pytermor

Release 2.0.0-dev.11

Alexandr Shavykin

Jul 05, 2022

CONTENTS

(yet another) Python library designed for formatting terminal output using ANSI escape codes. Implements automatic *"soft"* format termination. Provides a registry of low-level SGR (Select Graphic Rendition) `sequences` and formatting `spans` (or combined sequences). Also includes a set of formatters for pretty output.

Key feature of this library is providing necessary abstractions for building complex text sections with lots of formatting, while keeping the application code clear and readable.

No dependencies besides Python Standard Library are required (there are some for testing and docs building, though).

`@TODO` This is how you **should** format examples:

Fig. 1: https://chrisyeh96.github.io/2020/03/28/terminal-colors.html#color-schemes

CHAPTER

ONE

GUIDE

1.1 Getting started

1.1.1 Installation

```
pip install pytermor
```

1.1.2 Features

One of the core concepts of the library is *Span* class. Span is a combination of two control sequences; it wraps specified string with pre-defined leading and trailing SGR definitions.

Example code:

```
from pytermor import span

print(span.RED('Feat') + span.BOLD('ures'))
```

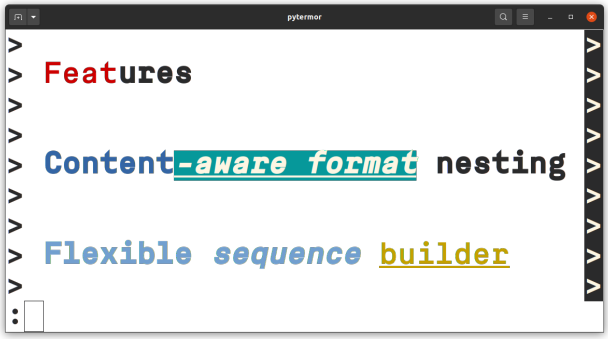
Content-aware format nesting

Compose text spans with automatic content-aware span termination. Preset spans can safely overlap with each other (as long as they require different *breaker* sequences to reset).

```
from pytermor import Span

span1 = Span('blue', 'bold')
span2 = Span('cyan', 'inversed', 'underlined', 'italic')

msg = span1(f'Content{span2("-aware format")} nesting')
print(msg)
```



Flexible sequence builder

Create your own *SGR sequences* with *build()* method, which accepts color/attribute keys, integer codes and even existing *SGRs*, in any amount and in any order. Key resolving is case-insensitive.

```
from pytermor import sequence, build

seq1 = build('hi_blue', 1)  # keys or integer codes
seq2 = build(seq1, sequence.ITALIC)  # existing SGRs
seq3 = build('underlined', 'YELLOW')  # case-insensitive

msg = f'{seq1}Flexible{sequence.RESET} ' + \
      f'{seq2}sequence{sequence.RESET} ' + \
      str(seq3) + 'builder' + str(sequence.RESET)
print(msg)
```

256 colors / True Color support

The library supports extended color modes:

- XTerm 256 colors indexed mode (see *Color / attribute preset list*);
- True Color RGB mode (16M colors).

```
from pytermor import color_indexed, color_rgb, sequence

start_color = 41
for idx, c in enumerate(range(start_color, start_color+(36*6), 36)):
    print(f'{color_indexed(c)}{sequence.COLOR_OFF}', end='')

print('\n')
for idx, c in enumerate(range(0, 256, 256//17)):
    r = max(0, 255-c)
    g = max(0, min(255, 127-(c*2)))
    b = c
    print(f'{color_rgb(r, g, b)}{sequence.COLOR_OFF}', end='')
```

Customizable output formats

@TODO

String and number formatters

@TODO

1.2 High-level abstractions

1.2.1 *Colors* and *Styles*

1.2.2 Output format control

1.2.3 Color mode fallbacks

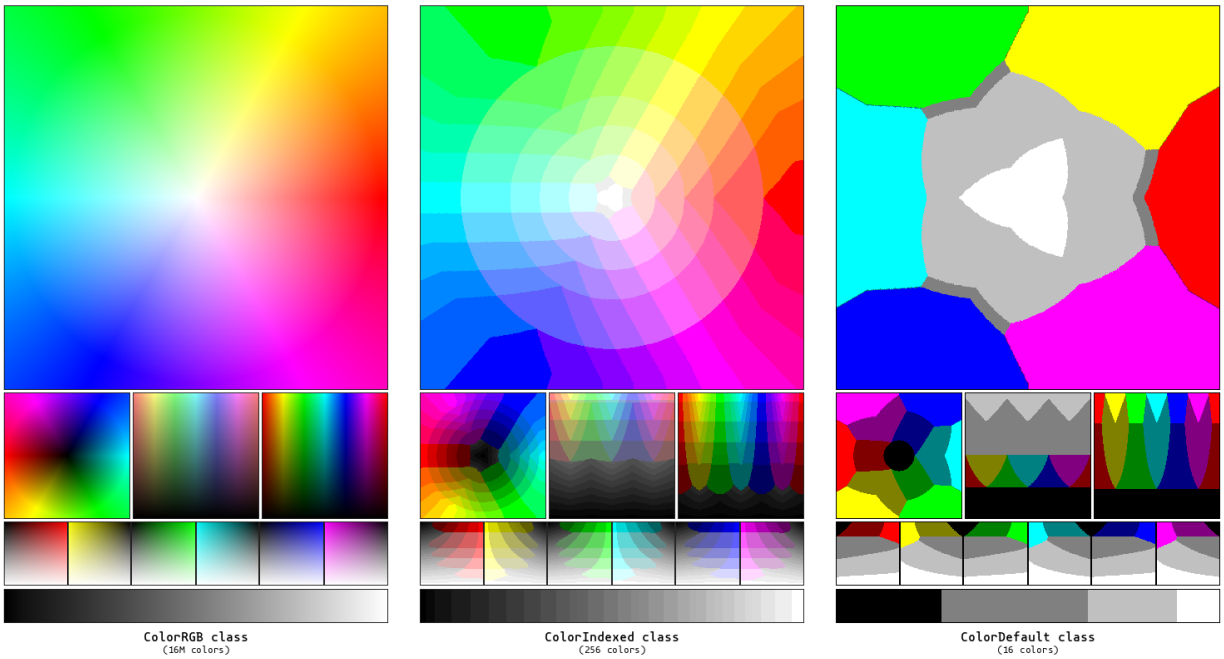


Fig. 1: Color approximations for indexed modes

1.2.4 Core API

@EXAMPLES

1.3 Low-level abstractions

So, what's happening under the hood?

1.3.1 Format soft reset

There are two ways to manage color and attribute termination:

- hard reset (SGR-0 or `e[0m`)
- soft reset (SGR-22, 23, 24 etc.)

The main difference between them is that *hard* reset disables all formatting after itself, while *soft* reset disables only actually necessary attributes (i.e. used as opening sequence in *Span* instance's context) and keeps the other.

That's what `Span` class is designed for: to simplify creation of soft-resetting text spans, so that developer doesn't have to restore all previously applied formats after every closing sequence.

Example

We are given a text span which is initially *bold* and *underlined*. We want to recolor a few words inside of this span. By default this will result in losing all the formatting to the right of updated text span (because *RESET*, or `e[0m`, clears all text attributes).

However, there is an option to specify what attributes should be disabled or let the library do that for you:

```
from pytermor import sequence, span, Span

# automatically:
span_warn = Span(sequence.HI_YELLOW + sequence.UNDERLINED)
# or explicitly:
span_warn = Span.new(
    sequence.HI_YELLOW + sequence.UNDERLINED,  # sequences can be summed up, remember?
    sequence.COLOR_OFF + sequence.UNDERLINED_OFF,  # "counteractive" sequences
    hard_reset_after=False
)

orig_text = span.BOLD(f'this is {sequence.BG_GRAY}the original{sequence.RESET} string')
updated_text = orig_text.replace('original', span_warn('updated'), 1)
print(orig_text, '\n', updated_text)
```

As you can see, the update went well – we kept all the previously applied formatting. Of course, this method cannot be 100% applicable; for example, imagine that original text was colored blue. After the update "string" word won't be blue anymore, as we used `sequence.COLOR_OFF` escape sequence to neutralize our own yellow color. But it still can be helpful for a majority of cases (especially when text is generated and formatted by the same program and in one go).

1.3.2 Working with *Spans*

Use *Span* constructor to create new instance with specified control sequence(s) as a opening/starter sequence and **automatically composed** closing sequence that will terminate attributes defined in opening sequence while keeping the others (soft reset).

Resulting sequence params' order is the same as argument's order.

Each sequence param can be specified as:

- string key (see *Color / attribute preset list*);
- integer param value;
- existing *SequenceSGR* instance (params will be extracted).

It's also possible to avoid auto-composing mechanism and create *Span* with explicitly set parameters using *Span.new()*.

1.3.3 Creating and applying *SGRs*

You can use any of predefined sequences from *sequence* or create your own via standard constructor. Valid argument values as well as preset constants are described in *Color / attribute preset list* page.

There is also a set of methods for dynamic `SequenceSGR` creation:

- *build()* for non-specific sequences;

Important: `SequenceSGR` with zero params was specifically implemented to translate into an empty string and not into `e[m`, which would make sense, but also could be very entangling, as terminal emulators interpret that sequence as `e[0m`, which is *hard* reset sequence.

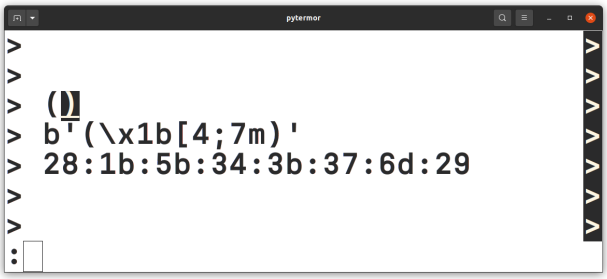
- *color_indexed()* for complex color selection sequences operating in 256-colors mode (for a complete list see *Color / attribute preset list*);
- *color_rgb()* for setting the colors in True Color 16M mode (however, some terminal emulators doesn't support it).

To get the resulting sequence chars use *encode()* method or cast instance to *str*.

```
from pytermor.sequence import SequenceSGR

seq = SequenceSGR(4, 7)
msg = f'({seq})'

print(msg + f'{SequenceSGR(0).encode()}')
print(str(msg.encode()))
print(msg.encode().hex(':'))
```



- First line is the string with encoded escape sequence;
- Second line shows up the string in raw mode, as if sequences were ignored by the terminal;
- Third line is hexademical string representation.

1.3.4 SGR sequence structure

1. `\x1b` is ESC *control character*, which opens a control sequence.
2. `[` is sequence *introducer*; it determines the type of control sequence (in this case it's CSI (Control Sequence Introducer)).
3. `4` and `7` are *parameters* of the escape sequence; they mean "underlined" and "inversed" attributes respectively. Those parameters must be separated by `;`.
4. `m` is sequence *terminator*; it also determines the sub-type of sequence, in our case SGR. Sequences of this kind are most commonly encountered.

1.3.5 Combining *SGRs*

One instance of *SequenceSGR* can be added to another. This will result in a new SequenceSGR with combined params.

```
from pytermor import sequence
from pytermor.sequence import SequenceSGR

combined = SequenceSGR(1, 31) + SequenceSGR(4)
print(f'{combined}combined{sequence.RESET}', str(combined).encode())
```

1.3.6 Core API

- @TODO
- *Span* constructor
- *Span.new()*

1.4 Color / attribute preset list

Preset lists are omitted from API docs to avoid unnesessary duplication; summary list of all presets defined in the library (not including *util.**) is displayed here.

There are two types of color palettes used in modern terminals – first one containing 16 colors (library references that palette as *default*, see *ColorDefault*), and second one consisting of 256 colors (referenced as *indexed*, e.g. *ColorIndexed*). There is also True Color mode (referenced as *RGB* mode), but it is not palette-based.

Actual colors of *default* palette depend on user's terminal settings, i.e. the result color of `ColorDefault` is not guaranteed to exactly match the corresponding color in the list below. However, usually that's not an issue, because users expect their terminal theme to work (almost) everythere and will be surprised when the applicationforcefully override default colors with custom ones (in any case, that can be accomplished by using *ColorRGB* or `ColorIndexed`; their color values are hard to customize without special configurations; but it's recommended not to use them for regular output).

Legend

- INT (intcode module -- 1st or 3rd SGR param value)
- SEQ (sequence module)
- SPN (span module)
- CLR (color module)
- STY (style module)

1.4.1 Meta, attributes, breakers

	Name	INT	SEQ	SPN	CLR	STY	Description
Meta							
	NOOP		V	V	V	V	No-operation; always encoded as empty string
	RESET	0	V				Reset all attributes and colors
Attributes							
	BOLD	1	V	V		V[1]	Bold or increased intensity
	DIM	2	V	V		V	Faint, decreased intensity
	ITALIC	3	V	V		V	Italic; *not widely supported*
	UNDERLINED	4	V	V		V	Underline
	BLINK_SLOW	5	V			V[2]	Set blinking to < 150 cpm
	BLINK_FAST	6	V				Set blinking to 150+ cpm; *not widely supported*
	INVERSED	7	V	V		V	Swap foreground and background colors
	HIDDEN	8	V				Conceal characters; *not widely supported*
	CROSSLINED	9	V			V	Strikethrough
	DOUBLE_UNDERLINED	21	V				Double-underline; *on several terminals disables* BOLD *instead*
	COLOR_EXTENDED	38					Set foreground color [*indexed/RGB* mode]; *use* color_indexed *and* color_rgb *instead*
	BG_COLOR_EXTENDED	48					Set background color [*indexed/RGB* mode]; *use* color_indexed *and* color_rgb *instead*
	OVERLINED	53	V	V		V	Overline; *not widely supported*
Breakers							
	BOLD_DIM_OFF	22	V				Disable BOLD and DIM attributes. *Special aspects... It's impossible to reliably disable them on a separate basis.*
	ITALIC_OFF	23	V				Disable italic
	UNDERLINED_OFF	24	V				Disable underlining
	BLINK_OFF	25	V				Disable blinking
	INVERSED_OFF	27	V				Disable inversing
	HIDDEN_OFF	28	V				Disable conecaling
	CROSSLINED_OFF	29	V				Disable strikethrough
	COLOR_OFF	39	V				Reset foreground color
	BG_COLOR_OFF	49	V				Reset background color
	OVERLINED_OFF	55	V				Disable overlining

[1] for this and subsequent items in "Attributes" section: as boolean flags.
[2] as blink.

1.4.2 *Default* colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
Foreground *default* colors								
	BLACK	30	V	V	V		#000000	Black
	RED	31	V	V	V		#800000	Maroon
	GREEN	32	V	V	V		#008000	Green
	YELLOW	33	V	V	V		#808000	Olive
	BLUE	34	V	V	V		#000080	Navy
	MAGENTA	35	V	V	V		#800080	Purple
	CYAN	36	V	V	V		#008080	Teal
	WHITE	37	V	V	V		#c0c0c0	Silver
Background *default* colors								
	BG_BLACK	40	V	V	V		#000000	Black
	BG_RED	41	V	V	V		#800000	Maroon
	BG_GREEN	42	V	V	V		#008000	Green
	BG_YELLOW	43	V	V	V		#808000	Olive
	BG_BLUE	44	V	V	V		#000080	Navy
	BG_MAGENTA	45	V	V	V		#800080	Purple
	BG_CYAN	46	V	V	V		#008080	Teal
	BG_WHITE	47	V	V	V		#c0c0c0	Silver
High-intensity foreground *default* colors								
	GRAY	90	V	V	V		#808080	Grey
	HI_RED	91	V	V	V		#ff0000	Red
	HI_GREEN	92	V	V	V		#00ff00	Lime
	HI_YELLOW	93	V	V	V		#ffff00	Yellow
	HI_BLUE	94	V	V	V		#0000ff	Blue
	HI_MAGENTA	95	V	V	V		#ff00ff	Fuchsia
	HI_CYAN	96	V	V	V		#00ffff	Aqua
	HI_WHITE	97	V	V	V		#ffffff	White
High-intensity background *default* colors								
	BG_GRAY	100	V	V	V		#808080	Grey
	BG_HI_RED	101	V	V	V		#ff0000	Red
	BG_HI_GREEN	102	V	V	V		#00ff00	Lime
	BG_HI_YELLOW	103	V	V	V		#ffff00	Yellow
	BG_HI_BLUE	104	V	V	V		#0000ff	Blue
	BG_HI_MAGENTA	105	V	V	V		#ff00ff	Fuchsia
	BG_HI_CYAN	106	V	V	V		#00ffff	Aqua
	BG_HI_WHITE	107	V	V	V		#ffffff	White

1.4.3 *Indexed* colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
	IDX_BLACK[3]	0			V		#000000	Black
	IDX_MAROON	1			V		#800000	Maroon
	IDX_GREEN	2			V		#008000	Green
	IDX_OLIVE	3			V		#808000	Olive
	IDX_NAVY	4			V		#000080	Navy
	IDX_PURPLE	5			V		#800080	Purple
	IDX_TEAL	6			V		#008080	Teal
	IDX_SILVER	7			V		#c0c0c0	Silver
	IDX_GRAY	8			V		#808080	Grey
	IDX_RED	9			V		#ff0000	Red
	IDX_LIME	10			V		#00ff00	Lime
	IDX_YELLOW	11			V		#ffff00	Yellow
	IDX_BLUE	12			V		#0000ff	Blue
	IDX_FUCHSIA	13			V		#ff00ff	Fuchsia
	IDX_AQUA	14			V		#00ffff	Aqua
	IDX_WHITE	15			V		#ffffff	White
	IDX_GREY_0	16			V		#000000	Grey0

1.6 Formatters and Filters

The library contains @TODO

[3] First 16 colors are effectively the same as colors in *default* 16-color mode and share with them the same color values (and depend on terminal color scheme as well).

[4] XTerm name list contains duplicates; variable names for these were slightly modified (different numbers at the end) to avoid namespace conflicts. All non-matching names are displayed using **bold** font.

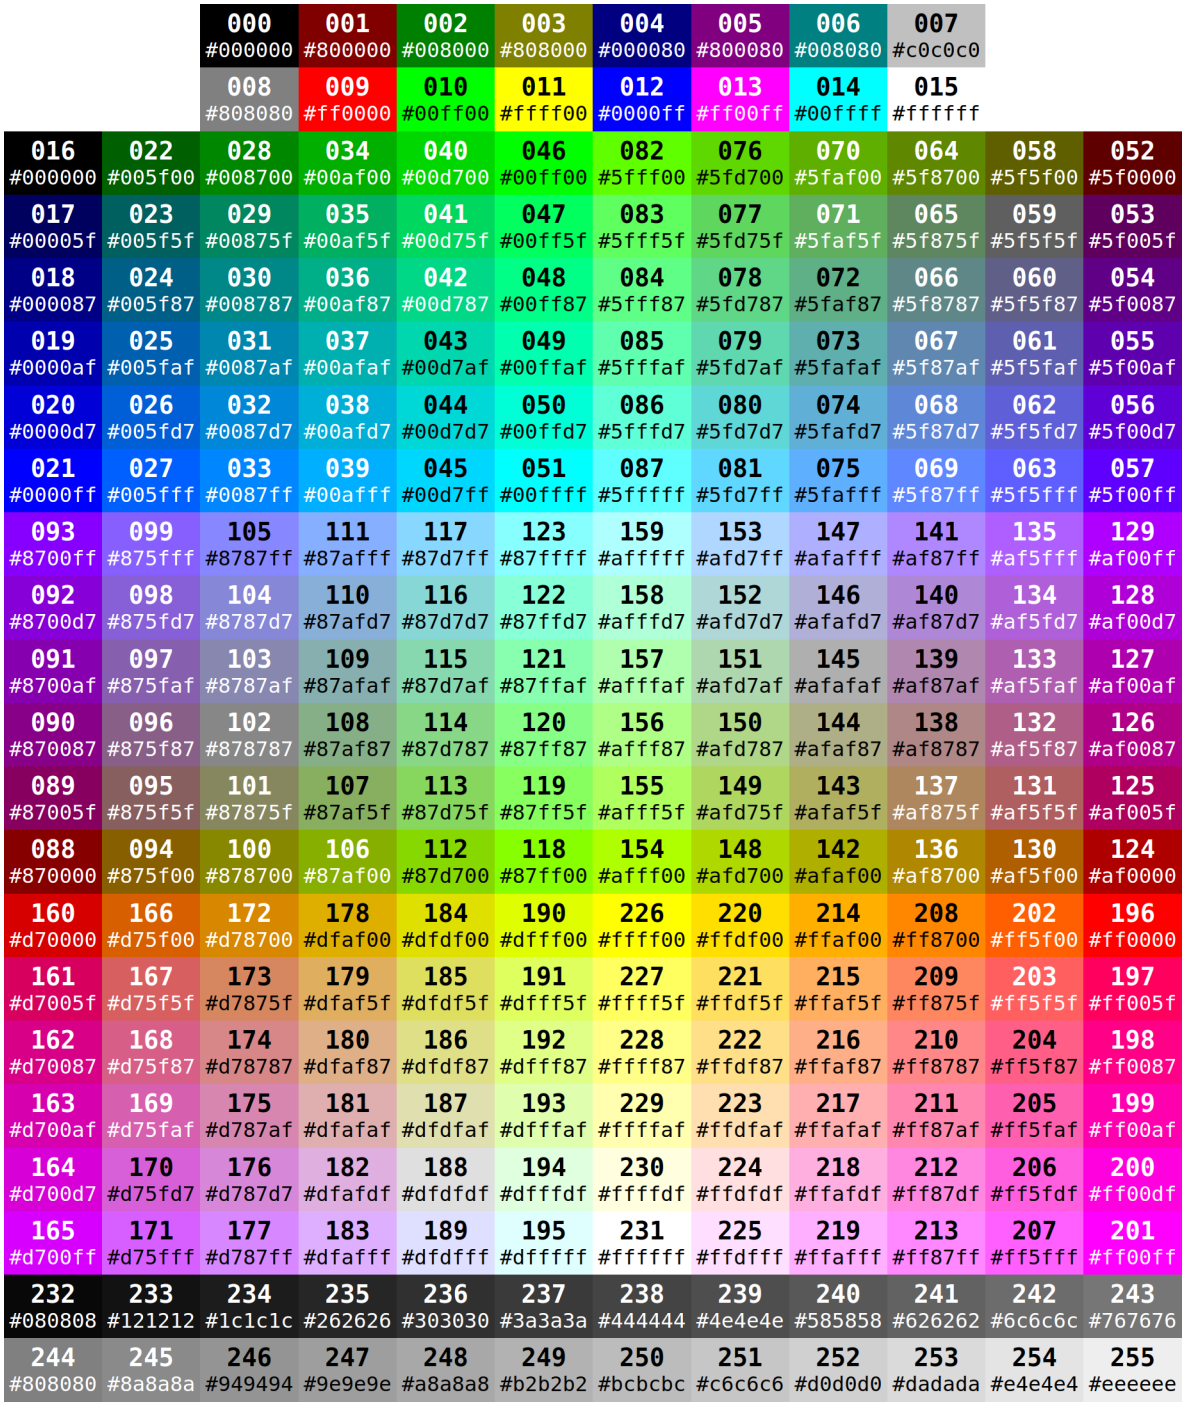

Fig. 2: *Indexed* mode palette

1.6.1 Auto-float formatter

1.6.2 Prefixed-unit formatter

1.6.3 Time delta formatter

```
from pytermor import Style, color, ColorRGB
from pytermor import renderer
from pytermor.util import time_delta

seconds_list = [2, 10, 60, 2700, 32340, 273600, 4752000, 864000000]
max_len_list = [3, 6, 10]

custom_stylesheet = time_delta.TimeDeltaStylesheet(
    default=Style(bg_color=0x202028),
    digit=Style(0x3333000, 'yellow'),
    unit=Style(fg_color='green', bg_color=0x202028, underlined=True),
    overflow=Style(fg_color=color.BLACK, bg_color='hi_red', bold=True),
)
for max_len in max_len_list:
    formatter = time_delta.registry.find_matching(max_len)
    formatter.stylesheet = custom_stylesheet

renderer.SGRRenderer.set_as_default()
for seconds in seconds_list:
    for max_len in max_len_list:
        formatter = time_delta.registry.get_by_max_len(max_len)
        print(formatter.format(seconds, True), end=' ')
    print()
```

CHAPTER

TWO

API DOCS

2.1 color

@TODO

class pytermor.color.**Color**(*hex_value: Optional[int] = None*)

Abstract superclass for other Colors.

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms hex_value in 0xFFFFFF format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms hex_value in 0xFFFFFF format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

Parameters
hex_value –

Returns

abstract classmethod get_default() → *Color*

Returns
Fallback instance of *Color* inheritor (if registries are empty).

abstract classmethod find_closest(*hex_value: int*) → *Color*

Wrapper for *_ColorMap.find_closest()*.

Parameters
hex_value – Integer color value in 0xFFFFFF format.

Returns
Nearest found color of specified type.

abstract to_sgr_default(*bg: bool*) → *SequenceSGR*

abstract to_sgr_indexed(*bg: bool*) → *SequenceSGR*

abstract to_sgr_rgb(*bg: bool*) → *SequenceSGR*

property hex_value: int | None

format_value(*prefix: str | None = '0x'*) → str

class pytermor.color.**ColorDefault**(*hex_value: int*, *code_fg: int*, *code_bg: int*)

Bases: *Color*

classmethod get_default() → *ColorDefault*

Returns
Fallback instance of *Color* inheritor (if registries are empty).

classmethod find_closest(*hex_value: int*) → *ColorDefault*

Wrapper for *_ColorMap.find_closest()*.

Parameters
hex_value – Integer color value in `0xFFFFFF` format.

Returns
Nearest found *ColorDefault* instance.

```
>>> ColorDefault.find_closest(0x660000)
ColorDefault[fg=31, bg=41, 0x800000]
```

to_sgr_default(*bg: bool*) → *SequenceSGR*

to_sgr_indexed(*bg: bool*) → *SequenceSGR*

to_sgr_rgb(*bg: bool*) → *SequenceSGR*

format_value(*prefix: str | None = '0x'*) → str

property hex_value: int | None

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms `hex_value` in `0xFFFFFF` format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

Parameters
hex_value –

Returns

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms `hex_value` in `0xFFFFFF` format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

class pytermor.color.**ColorIndexed**(*hex_value: int*, *code: int*)

Bases: *Color*

classmethod get_default() → *ColorIndexed*

Returns
Fallback instance of *Color* inheritor (if registries are empty).

classmethod find_closest(*hex_value: int*) → *ColorIndexed*

Wrapper for *_ColorMap.find_closest()*.

Parameters
hex_value – Integer color value in 0xFFFFFF format.

Returns
Nearest found *ColorIndexed* instance.

```
>>> ColorIndexed.find_closest(0xd9dbdb)
ColorIndexed[code=253, 0xdadada]
```

to_sgr_default(*bg: bool*) → *SequenceSGR*

to_sgr_indexed(*bg: bool*) → *SequenceSGR*

to_sgr_rgb(*bg: bool*) → *SequenceSGR*

format_value(*prefix: str | None = '0x'*) → str

property hex_value: int | None

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms hex_value in 0xFFFFFF format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

Parameters
hex_value –

Returns

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms hex_value in 0xFFFFFF format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

class pytermor.color.**ColorRGB**(*hex_value: Optional[int] = None*)

Bases: *Color*

classmethod get_default() → *ColorRGB*

Returns
Fallback instance of *Color* inheritor (if registries are empty).

classmethod find_closest(*hex_value: int*) → *ColorRGB*

Wrapper for *_ColorMap.find_closest()*. *ColorRGB*-type color map works by simplified algorithm – without caching and searching – it just checks if instance with same hex value was already created, and returns it if it was, or returns a brand new instance with required color value. In second case color map also puts new instance into its lookup table.

Parameters
hex_value – Integer color value in `0xFFFFFF` format.

Returns
Existing *ColorRGB* instance or newly created one.

```
>>> existing_color1 = ColorRGB(0x660000)
>>> existing_color2 = ColorRGB(0x660000)
>>> existing_color1 == existing_color2
True
>>> existing_color1 is existing_color2  # different instances
False
>>> existing_color1 == ColorRGB.find_closest(0x660000)
True
>>> existing_color1 is ColorRGB.find_closest(0x660000)  # same instance
True
```

to_sgr_default(*bg: bool*) → *SequenceSGR*

to_sgr_indexed(*bg: bool*) → *SequenceSGR*

to_sgr_rgb(*bg: bool*) → *SequenceSGR*

format_value(*prefix: str | None = '0x'*) → str

property hex_value: int | None

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms `hex_value` in `0xFFFFFF` format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

Parameters
hex_value –

Returns

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms `hex_value` in `0xFFFFFF` format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

pytermor.color.**TypeColor**

Any non-abstract *Color* type.

alias of TypeVar('TypeColor', ColorDefault, ColorIndexed, ColorRGB)

class pytermor.color.**_ColorMap**(*parent_type: TypeColor*)

Bases: `Generic`[*TypeColor*]

Class contains a dictionary of registred *Colors* indexed by hex code along with cached nearest color search results to avoid unnecessary instance copies and search repeating.

add_to_map(*color: TypeColor*)

Called in *Color*-type class constructors. Add a new element in color lookup table if it wasn't there, and then drop cached search results as they are most probably useless after registering a new color (i.e. now there will be better result for at least one cached value).

Parameters
color – *Color* instance being created.

find_closest(*hex_value: int*) → TypeColor

Search for nearest to `hex_value` registered color. Is used by *SGRRenderer* to find supported color alternatives in case user's terminal is incapable of operating in better mode. For example, renderer will try to pick most suitable *indexed* colors instead of *RGB* colors if it ensures that terminal doesn't support True Color mode.

Parameters
hex_value – Rendering color RGB value.

Returns
Nearest to `hex_value` registered `Color`. Type is equal to parent *Color* type. If no colors of required type were created (table and cache are empty), invokes *get_default()* `Color` method.

pytermor.color.**NOOP = ColorRGB[]**

Special instance of *Color* class always rendering into empty string.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Color / attribute preset list* section of the guide.

2.2 intcode

Module with SGR param integer codes, contains a complete or almost complete list of reliably working ones.

Suitable for *Span* and *SequenceSGR* default constructors.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Color / attribute preset list* section of the guide.

2.3 renderer

Module with output formatters. By default *SGRRenderer* is used.

Abstract parent class *Renderer* contains global (library-wide) compatibility settings. See *Renderer.set_up()*.

Working with non-default renderer can be accomplished in two ways:

1. There is a module-level variable *DefaultRenderer* determining what renderer *Style.render()* method will be using. Default renderer can be swapped with another one using *Renderer.set_as_default()* class method of the latter.

2. Alternatively, you can use renderer's own class method *Renderer.render()* directly and avoid calling `Style.render()` method whatsoever.

```
>>> Renderer.set_up(True)
>>> DebugRenderer.set_as_default()
>>> Style('red').render('_text_')
'[31m_text_[39m'
>>> NoOpRenderer.render(Style('red'), 'text')
'text'
```

class pytermor.renderer.**Renderer**

Abstract parent of all other renderers. Among other things also contains settings shared between all renderer types that can be customized by developer at runtime.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

abstract classmethod render(*style:* Style, *text: str*) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

class pytermor.renderer.**SGRRenderer**

Bases: *Renderer*

Default renderer that *Style.render()* invokes. Transforms *Color* instances defined in `style` argument into ANSI control sequence characters and merges them with input string.

classmethod render(*style:* Style, *text: str*)

Render `text` with `style` applied as ANSI control sequences.

Respects compatibility preferences (see *set_up()*) and maps RGB colors to closest *indexed* colors if terminal doesn't support RGB output. In case terminal doesn't support even 256 colors, falls back to *default* colors, searching for closest counterparts in 16-color table.

Type of output SequenceSGR depends on type of *Color* variables in `style` argument. Keeping all that in mind, let's summarize:

1. *ColorRGB* can be rendered as True Color sequence, indexed sequence and default (16-color) sequence depending on terminal capabilities.
2. *ColorIndexed* can be rendered as indexed sequence or default sequence.
3. *ColorDefault* will be rendered as default-color sequence.

Parameters

- **style** – Style to apply.
- **text** – Input string.

Returns

Input string enclosed in SGR sequences.

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.**TmuxRenderer**

Bases: *Renderer*

abstract classmethod render(*style:* Style, *text: str*) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.**NoOpRenderer**

Bases: *Renderer*

classmethod render(*style:* Style, *text: str*) → str

Special renderer type that does nothing with the input string and just returns it as is.

```
>>> NoOpRenderer.render(Style(0xff00ff), 'text')
'text'
```

Parameters

- **style** – Style to ignore.
- **text** – Input string.

Returns

Input string without changes.

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).

  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.**HtmlRenderer**

Bases: *Renderer*

classmethod render(*style:* Style, *text: str*) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.**DebugRenderer**

Bases: *Renderer*

classmethod render(*style:* Style, *text: str*) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod set_as_default()

Set renderer as default for *Style.render()* invocations.

static set_up(*force_styles: bool | None = False*, *compatibility_indexed: bool = False*, *compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
  - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
  - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
  - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

pytermor.renderer.**DefaultRenderer**

alias of *SGRRenderer*

2.4 sequence

Module contains definitions for low-level ANSI escape sequences handling.

Each preset defined below is a valid argument for *Span* and *SequenceSGR* default constructors (case-insensitive):

```
Span(sequence.BG_GREEN, sequence.UNDERLINED)
```

pytermor.sequence.**build**(**args: str | int | SequenceSGR*) → *SequenceSGR*

Create new *SequenceSGR* with specified `args` as params.

Resulting sequence param order is same as an argument order.

Each sequence param can be specified as:

- string key (see *span*)
- integer param value (from *intcode*)
- existing `SequenceSGR` instance (params will be extracted).

Examples:

```
>>> build('yellow', 'bold')
SGR[33;1]
>>> build(91, 7)
SGR[91;7]
>>> build(HI_CYAN, UNDERLINED)
SGR[96;4]
```

pytermor.sequence.**color_indexed**(*color: int*, *bg: bool = False*) → *SequenceSGR*

Wrapper for creation of *SequenceSGR* that sets foreground (or background) to one of 256-color pallete value.

Parameters

- **color** – Index of the color in the pallete, 0 – 255.
- **bg** – Set to *True* to change the background color (default is foreground).

Returns

SequenceSGR with required params.

pytermor.sequence.**color_rgb**(*r: int*, *g: int*, *b: int*, *bg: bool = False*) → *SequenceSGR*

Wrapper for creation of *SequenceSGR* operating in True Color mode (16M). Valid values for *r*, *g* and *b* are in range [0; 255]. This range linearly translates into [`0x00`; `0xFF`] for each channel. The result value is composed as `#RRGGBB`. For example, sequence with color of `#FF3300` can be created with:

```
color_rgb(255, 51, 0)
```

Parameters

- **r** – Red channel value, 0 – 255.
- **g** – Blue channel value, 0 – 255.
- **b** – Green channel value, 0 – 255.
- **bg** – Set to *True* to change the background color (default is foreground).

Returns

SequenceSGR with required params.

class pytermor.sequence.**SequenceSGR**(**params: int*)

Bases: `_SequenceCSI`

Class representing SGR-type escape sequence with varying amount of parameters.

SequenceSGR with zero params was specifically implemented to translate into empty string and not into `e[m`, which would have made sense, but also would be very entangling, as this sequence is equivalent of `e[0m` – hard reset sequence. The empty-string-sequence is predefined as *NOOP*.

It's possible to add of one SGR sequence to another:

```
>>> SequenceSGR(31) + SequenceSGR(1) == SequenceSGR(31, 1)
True
```

encode() → str

Build up actual byte sequence and return as an ASCII-encoded string.

property params: List[int]

Return internal params as array.

classmethod regexp() → str

pytermor.sequence.**NOOP = SGR[]**

Special sequence in case where you *have to* provide one or another SGR, but do not want any control sequence to be actually included.

- `NOOP.encode()` returns empty string.
- `NOOP.params` returns empty list.

```
>>> NOOP.encode()
''
>>> NOOP.params
[]
```

New in version 1.8.

pytermor.sequence.**RESET = SGR[0]**

Resets all attributes and colors.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Color / attribute preset list* section of the guide.

2.5 span

Module introducing *Span* low-level abstractions. The key difference beetween them and `Sequences` is that sequence can *open* text style and also *close*, or terminate it. As for `Spans` – they always do both; typical use-case of *Span* is to wrap some text in opening SGR and closing one.

class pytermor.span.**Span**(**opening_params: str | int | SequenceSGR*)

Create a *Span* with specified control sequence(s) as an opening sequence and **automatically compose** second (closing) sequence that will terminate attributes defined in the first one while keeping the others (*soft* reset).

Resulting sequence param order is same as an argument order.

Each argument can be specified as:

- string key (name of any constant defined in *intcode*, case-insensitive)
- integer param value (defined in *intcode*)
- existing *SequenceSGR* instance (params will be extracted).

```
>>> Span('red', 'bold')
Span[SGR[31;1], SGR[39;22]]
>>> Span(intcode.GREEN)
Span[SGR[32], SGR[39]]
>>> Span(93, 4)
Span[SGR[93;4], SGR[39;24]]
>>> Span(sequence.BG_BLACK + sequence.RED)
Span[SGR[40;31], SGR[49;39]]
```

Parameters

opening_params – string keys, integer codes or existing `SequenceSGR` instances to build `Span` from.

classmethod new(*opening_seq: Optional[SequenceSGR] = None*, *closing_seq: Optional[SequenceSGR] = None*, *hard_reset_after: bool = False*) → *Span*

Create new *Span* with explicitly specified opening and closing sequences.

Note: *closing_seq* gets overwritten with *sequence.RESET* if `hard_reset_after` is *True*.

Parameters

- **opening_seq** – Starter sequence, in general determening how *Span* will actually look like.
- **closing_seq** – Finisher SGR sequence.
- **hard_reset_after** – Terminate *all* formatting after this span.

wrap(*text: Optional[Any] = None*) → str

Wrap given `text` string with SGRs defined on initialization – *opening_seq* on the left, *closing_seq* on the right. `str(text)` will be invoked for all argument types with the exception of *None*, which will be replaced with an empty string.

Parameters

text – String to wrap.

Returns

`text` enclosed in instance's SGRs, if any.

property opening_str: str

Return opening SGR sequence encoded.

property opening_seq: *SequenceSGR*

Return opening SGR sequence instance.

property closing_str: str

Return closing SGR sequence encoded.

property closing_seq: *SequenceSGR*

Return closing SGR sequence instance.

__call__(*text: Optional[Any] = None*) → str

Can be used instead of *wrap()* method.

```
>>> RED('text') == RED.wrap('text')
True
```

pytermor.span.**NOOP = Span[SGR[], SGR[]]**

Special *Span* in cases where you *have to* select one or another *Span*, but do not want any control sequence to be actually included.

- `NOOP(string)` or `NOOP.wrap(string)` returns `string` without any modifications;
- `NOOP.opening_str` and `NOOP.closing_str` are empty strings;
- `NOOP.opening_seq` and `NOOP.closing_seq` both returns *sequence.NOOP*.

```
>>> NOOP('text')
'text'
>>> NOOP.opening_str
''
```

(continues on next page)

(continued from previous page)

```
>>> NOOP.opening_seq
SGR[]
```

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Color / attribute preset list* section of the guide.

2.6 style

High-level abstraction defining text colors and attributes.

class pytermor.style.**Style**(*fg_color: str | int | Color = None*, *bg_color: str | int | Color = None*, *auto_fg: bool = False*, *blink: bool = False*, *bold: bool = False*, *crosslined: bool = False*, *dim: bool = False*, *double_underlined: bool = False*, *inversed: bool = False*, *italic: bool = False*, *overlined: bool = False*, *underlined: bool = False*)

Create a new `Style()`.

Key difference between `Styles` and `Spans` or `SGRs` is that `Styles` describe colors in RGB format and therefore support output rendering in several different formats (see *renderer*).

Both `fg_color` and `bg_color` can be specified as:

1. *Color* instance or library preset;
2. key code – name of any of aforementioned presets, case-insensitive;
3. integer color value in hexademical RGB format.

```
>>> Style('green', bold=True)
Style[fg=008000, no bg, bold]
>>> Style(bg_color=0x0000ff)
Style[no fg, bg=0000ff]
>>> Style(color.IDX_DEEP_SKY_BLUE_1, color.IDX_GREY_93)
Style[fg=00afff, bg=eeeeee]
```

Parameters

- **fg_color** – Foreground (i.e., text) color.
- **bg_color** – Background color.
- **auto_fg** – Automatically select `fg_color` based on `bg_color` (black or white depending on background brightness, if `bg_color` is defined).
- **blink** – Blinking effect; *supported by limited amount of Renderers*.
- **bold** – Bold or increased intensity.
- **crosslined** – Strikethrough.
- **dim** – Faint, decreased intensity.
- **double_underlined** – Faint, decreased intensity.
- **inversed** – Swap foreground and background colors.
- **italic** – Italic.

- **overlined** – Overline.
- **underlined** – Underline.

render(*text: Optional[Any] = None*) → str

Returns `text` with all attributes and colors applied.

By default uses *SequenceSGR* renderer, that means that output will contain ANSI escape sequences.

class pytermor.style.**Stylesheet**(*default: Optional[Style] = None*)

2.7 util

Package containing a set of formatters for prettier output, as well as utility classes for removing some of the boilerplate code when dealing with escape sequences.

pytermor.util.**format_thousand_sep**(*value: int | float*, *separator=' '*)

Returns input `value` with integer part splitted into groups of three digits, joined then with `separator` string.

```
>>> format_thousand_sep(260341)
'260 341'
>>> format_thousand_sep(-9123123123.55, ',')
'-9,123,123,123.55'
```

2.7.1 auto_float

pytermor.util.auto_float.**format_auto_float**(*value: float*, *req_len: int*, *allow_exponent_notation: bool = True*) → str

Dynamically adjust decimal digit amount and format to fill up the output string with as many significant digits as possible, and keep the output length strictly equal to *req_len* at the same time.

```
>>> format_auto_float(0.016789, 5)
'0.017'
>>> format_auto_float(0.167891, 5)
'0.168'
>>> format_auto_float(1.567891, 5)
'1.568'
>>> format_auto_float(12.56789, 5)
'12.57'
>>> format_auto_float(123.5678, 5)
'123.6'
>>> format_auto_float(1234.567, 5)
' 1235'
>>> format_auto_float(12345.67, 5)
'12346'
```

For cases when it's impossible to fit a number in the required length and rounding doesn't help (e.g. 12 500 000 and 5 chars) algorithm switches to scientific notation and the result looks like '1.2e7'.

When exponent form is disabled, there are two options for value that cannot fit into required length:

1) if absolute value is less than 1, zeros will be displayed ('0.0000');
2) in case of big numbers (like 10^9) ValueError will be raised instead.

Parameters

- **value** – Value to format
- **req_len** – Required output string length
- **allow_exponent_notation** – Enable/disable exponent form.

Returns
Formatted string of required length

Raises
ValueError –

New in version 1.7.

2.7.2 prefixed_unit

pytermor.util.prefixed_unit.**format_si_metric**(*value: float*) → str

Format `value` as unitless value with SI-prefixes, max result length is *6* chars. Base is *1000*.

```
>>> format_si_metric(123.456)
'123'
>>> format_si_metric(1080)
'1.08 k'
>>> format_si_metric(45200)
'45.2 k'
>>> format_si_metric(1257800)
'1.26 M'
```

Parameters
value – Input value (unitless).

Returns
Formatted string with SI-prefix if necessary.

New in version 2.0.

pytermor.util.prefixed_unit.**format_si_binary**(*value: float*) → str

Format `value` as binary size (bytes, kbytes, Mbytes), max result length is *8* chars. Base is *1024*.

```
>>> format_si_binary(631)
'631 b'
>>> format_si_binary(1080)
'1.055 kb'
>>> format_si_binary(45200)
'44.14 kb'
>>> format_si_binary(1257800)
'1.200 Mb'
```

Parameters
value – Input value in bytes.

Returns
Formatted string with SI-prefix if necessary.

New in version 2.0.

class pytermor.util.prefixed_unit.**PrefixedUnitFormatter**(*max_value_len: int*, *integer_input: bool = False*, *unit: str = None*, *unit_separator: str = None*, *mcoef: float = 1000.0*, *prefixes: List[str | None] = None*, *prefix_zero_idx: int = None*)

Formats `value` using settings passed to constructor. The main idea of this class is to fit into specified string length as much significant digits as it's theoretically possible by using multipliers and unit prefixes to indicate them.

You can create your own formatters if you need fine tuning of the output and customization. If that's not the case, there are facade methods *format_si_metric()* and *format_si_binary()*, which will invoke predefined formatters and doesn't require setting up.

@TODO params

Parameters
prefix_zero_idx – Index of prefix which will be used as default, i.e. without multiplying coefficients.

New in version 1.7.

property max_len: int

Returns
Maximum length of the result. Note that constructor argument is *max_value_len*, which is different parameter.

format(*value: float*) → str

Parameters
value – Input value

Returns
Formatted value

pytermor.util.prefixed_unit.**PREFIXES_SI = ['y', 'z', 'a', 'f', 'p', 'n', '', 'm', None, 'k', 'M', 'G', 'T', 'P', 'E', 'Z', 'Y']**

Prefix presets used by default module formatters. Can be useful if you are building your own formatter.

pytermor.util.prefixed_unit.**PREFIX_ZERO_SI = 8**

Index of prefix which will be used as default, i.e. without multiplying coefficients.

2.7.3 time_delta

Module for time difference formatting (e.g. "4 days 15 hours", "8h 59m").

Supports several output lengths and can be customized even more.

pytermor.util.time_delta.**format_time_delta**(*seconds: float*, *max_len: Optional[int] = None*) → str

Format time delta using suitable format (which depends on `max_len` argument). Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return "3h 48min" instead of "228 mins" or "3 hours",

There are predefined formatters with output length of 3, 4, 6 and 10 characters. Therefore, you can pass in any value from 3 inclusive and it's guarenteed that result's length will be less or equal to required length. If *max_len* is omitted, longest registred formatter will be used.

```
>>> format_time_delta(10, 3)
'10s'
>>> format_time_delta(10, 6)
'10 sec'
>>> format_time_delta(15350, 4)
'4 h'
>>> format_time_delta(15350)
'4h 15min'
```

Parameters

- **seconds** – Value to format
- **max_len** – Maximum output string length (total)

Returns

Formatted string

class pytermor.util.time_delta.**TimeDeltaFormatter**(*units: List[TimeUnit]*, *allow_negative: bool*, *unit_separator: Optional[str] = None*, *plural_suffix: Optional[str] = None*, *stylesheet: Optional[TimeDeltaStylesheet] = None*, *overflow_msg: str = 'OVERFLOW'*)

Formatter for time intervals. Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return "3h 48min" instead of "228 mins" or "3 hours", etc.

You can create your own formatters if you need fine tuning of the output and customization. If that's not the case, there is a facade method *format_time_delta()* which will select appropriate formatter automatically.

Example output:

```
"10 secs", "5 mins", "4h 15min", "5d 22h"
```

property stylesheet: *TimeDeltaStylesheet*

property max_len: int

This property cannot be set manually, it is computed on initialization automatically.

Returns

Maximum possible output string length.

format(*seconds: float*, *always_max_len: bool = False*) → str

Format the requested amount of seconds and apply styles to the result as defined in current formatter's *stylesheet*. Default `stylesheet` contains "noop" spans only and thus no styles will be applied.

Parameters

- **seconds** – Input value.
- **always_max_len** – If result string is less than *max_len* it will be returned as is, unless this flag is set to *True*. In that case output string will be paded with spaces on the left side so that resulting length would be always equal to maximum length.

Returns

Formatted string with applied styles if they are defined, raw string otherwise.

format_raw(*seconds: float*) → str | None

Format the requested amount of seconds as raw string without styling.

Parameters
seconds – Input value.

Returns
Formatted string or *None* on overflow (if input value is too big for the current formatter to handle).

class pytermor.util.time_delta.**TimeUnit**(*name: 'str'*, *in_next: 'int' = None*, *custom_short: 'str' = None*, *collapsible_after: 'int' = None*, *overflow_afer: 'int' = None*)

name: str

in_next: int = None

custom_short: str = None

collapsible_after: int = None

overflow_afer: int = None

class pytermor.util.time_delta.**TimeDeltaStylesheet**(*default: Optional[Style] = None*, *digit: Optional[Style] = None*, *unit: Optional[Style] = None*, *overflow: Optional[Style] = None*)

Bases: *Stylesheet*

2.7.4 stdlib_ext

Some of the Python Standard Library methods rewritten for correct work with strings containing control sequences.

pytermor.util.stdlib_ext.**ljust_sgr**(*s: str*, *width: int*, *fillchar: str = ' '*) → str

SGR-formatting-aware implementation of `str.ljust`.

Return a left-justified string of length `width`. Padding is done using the specified fill character (default is a space).

pytermor.util.stdlib_ext.**rjust_sgr**(*s: str*, *width: int*, *fillchar: str = ' '*) → str

SGR-formatting-aware implementation of `str.rjust`.

Return a right-justified string of length `width`. Padding is done using the specified fill character (default is a space).

pytermor.util.stdlib_ext.**center_sgr**(*s: str*, *width: int*, *fillchar: str = ' '*) → str

SGR-formatting-aware implementation of `str.center`.

Return a centered string of length `width`. Padding is done using the specified fill character (default is a space).

2.7.5 string_filter

String filtering module.

Main idea is to provide a common interface for string filtering, that can make possible working with filters like with objects rather than with functions/lambdas.

pytermor.util.string_filter.**apply_filters**(*s: AnyStr*, **args: StringFilter[AnyStr] | Type[StringFilter[AnyStr]]*) → AnyStr

Method for applying dynamic filter list to a target string/bytes. Example (will replace all `ESC` control characters to `E` and thus make SGR params visible):

```
>>> apply_filters(span.RED('test'), ReplaceSGR(r'E\2\3\5'))
'E[31mtestE[39m'
```

Note that type of `s` argument must be same as `StringFilter` parameterized type, i.e. *ReplaceNonAsciiBytes* is `StringFilter[bytes]` type, so you can apply it only to bytes-type strings.

Parameters

- **s** (*AnyStr*) – String to filter.
- **args** – *StringFilter* instance(s) or `StringFilter` class(es).

Returns

Filtered `s`.

class pytermor.util.string_filter.**StringFilter**(*pattern: AnyStr*, *repl: AnyStr | Callable[[AnyStr | Match], AnyStr]*)

Bases: `Generic`

Common string modifier interface.

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

apply(*s: AnyStr*) → AnyStr

Apply filter to `s` string (or bytes).

class pytermor.util.string_filter.**VisualuzeWhitespace**(*repl: AnyStr = '·'*)

Bases: *StringFilter*[`str`]

Replace every invisible character with `repl` (default is `·`), except newlines. Newlines are kept and get prepneded with same string.

```
>>> VisualuzeWhitespace().apply('A  B  C')
'A··B··C'
>>> apply_filters('1. D\n2. L ', VisualuzeWhitespace)
'1.·D·\n2.·L·'
```

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

apply(*s: AnyStr*) → AnyStr

Apply filter to `s` string (or bytes).

class pytermor.util.string_filter.**ReplaceSGR**(*repl: AnyStr = ''*)

Bases: *StringFilter*[`str`]

Find all SGR seqs (e.g. `ESC[1;4m`) and replace with given string. More specific version of *ReplaceCSI*.

Parameters

repl – Replacement, can contain regexp groups (see *apply_filters()*).

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

apply(*s: AnyStr*) → AnyStr

Apply filter to `s` string (or bytes).

class pytermor.util.string_filter.**ReplaceCSI**(*repl: AnyStr = ''*)

Bases: *StringFilter*[str]

Find all CSI seqs (i.e. ESC[*) and replace with given string. Less specific version of *ReplaceSGR*, as CSI consists of SGR and many other sequence subtypes.

Parameters
repl – Replacement, can contain regexp groups (see *apply_filters()*).

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

apply(*s: AnyStr*) → AnyStr

Apply filter to s string (or bytes).

class pytermor.util.string_filter.**ReplaceNonAsciiBytes**(*repl: AnyStr = b'?'*)

Bases: *StringFilter*[bytes]

Keep 7-bit ASCII bytes [0x00 - 0x7f], replace other to ?.

Parameters
repl – Replacement byte-string.

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

apply(*s: AnyStr*) → AnyStr

Apply filter to s string (or bytes).

CHAPTER

THREE

CHANGELOG

3.1 v2.0.0

- Complete library rewrite.
- High-level abstractions *Color*, *Renderer* and *Style*.
- Unit tests for formatters and new modules.
- `pytest` and `coverage` integration.
- `sphinx` and `readthedocs` integraton.

3.2 v1.8.0

- `format_prefixed_unit` extended for working with decimal and binary metric prefixes.
- *format_time_delta* extended with new settings.
- Value rounding transferred from *format_auto_float* to `format_prefixed_unit`.
- Utility classes reorganization.
- Unit tests output formatting.
- *sequence.NOOP* SGR sequence and *span.NOOP* format.
- Max decimal points for *auto_float* extended from (2) to (max-2).

3.3 v1.7.4

- Added 3 formatters: `format_prefixed_unit`, *format_time_delta*, *format_auto_float*.

3.4 v1.7.3

- Added `span.BG_BLACK` format.

3.5 v1.7.2

- Added *ljust_sgr*, *rjust_sgr*, *center_sgr* util functions to align strings with SGRs correctly.

3.6 v1.7.1

- Print reset sequence as `\e[m` instead of `\e[0m`.

3.7 v1.7.0

- *Span* constructor can be called without arguments.
- Added SGR code lists.

3.8 v1.6.2

- Excluded `tests` dir from distribution package.

3.9 v1.6.1

- Ridded of `EmptyFormat` and `AbstractFormat` classes.
- Renamed `code` module to `sgr` because of conflicts in PyCharm debugger (`pydevd_console_integration.py`).

3.10 v1.5.0

- Removed excessive `EmptySequenceSGR` – default `SGR` class was specifically implemented to print out as empty string instead of `\e[m` if constructed without params.

3.11 v1.4.0

- *Span.wrap()* now accepts any type of argument, not only `str`.
- Rebuilt `Sequence` inheritance tree.
- Added equality methods for *SequenceSGR* and *Span* classes/subclasses.
- Added some tests for `fmt.*` and `seq.*` classes.

3.12 v1.3.2

- Added `span.GRAY` and `span.BG_GRAY` format presets.

3.13 v1.3.1

- Interface revisioning.

3.14 v1.2.1

- *opening_seq* and *closing_seq* properties for *Span* class.

3.15 v1.2.0

- `EmptySequenceSGR` and `EmptyFormat` classes.

3.16 v1.1.0

- Autoformat feature.

3.17 v1.0.0

- First public version.

This project uses Semantic Versioning – https://semver.org *(starting from 2.0.0)*
