3	Changelog	43
4	License	47
	Python Module Index	49

(yet another) Python library designed for formatting terminal output using ANSI escape codes. Implements automatic "soft" format termination. Provides a registry of low-level SGR (Select Graphic Rendition) *sequences* and formatting *spans* (or combined sequences). Also includes a set of formatters for pretty output.

Key feature of this library is providing necessary abstractions for building complex text sections with lots of formatting, while keeping the application code clear and readable.

No dependencies besides Python Standard Library are required (*there are some for testing and docs building, though*).

@TODO This is how you **should** format examples:

We put these pieces together to create a SGR command. Thus, `ESC[1m` specifies bold (or bright) text, and `ESC[31m` specifies red foreground text. We can chain together parameters; for example, `ESC[32;47m` specifies green foreground text on a white background.

The following diagram shows a complete example for rendering the word "text" in red with a single underline.

Notes

- For terminals that support bright foreground colors, `ESC[1;3Xm` is usually equivalent to `ESC[9Xm` (where `X` is a digit in 0-7). However, the reverse does not seem to hold, at least anecdotally: `ESC[2;9Xm` usually does not render the same as `ESC[3Xm`.
- Not all terminals support every effect.

Fig. 1: <https://chrisyeh96.github.io/2020/03/28/terminal-colors.html#color-schemes>

1.1 Getting started

1.1.1 Installation

```
pip install pytermor
```

1.1.2 Features

One of the core concepts of the library is *Span* class. *Span* is a combination of two control sequences; it wraps specified string with pre-defined leading and trailing SGR definitions.

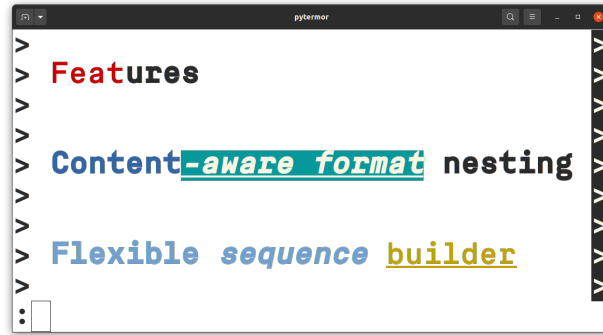

Example code:

```
1 from pytermor import span
2
3 print(span.RED('Feat') + span.BOLD('ures'))
```

Content-aware format nesting

Compose text spans with automatic content-aware span termination. Preset spans can safely overlap with each other (as long as they require different *breaker* sequences to reset).

```
1 from pytermor import Span
2
3 span1 = Span('blue', 'bold')
4 span2 = Span('cyan', 'inversed', 'underlined', 'italic')
5
6 msg = span1(f'Content{span2("-aware format")} nesting')
7 print(msg)
```

Flexible sequence builder

Create your own *SGR sequences* with `build()` method, which accepts color/attribute keys, integer codes and even existing *SGRs*, in any amount and in any order. Key resolving is case-insensitive.

```
1 from pytermor import sequence, build
2
3 seq1 = build('hi_blue', 1) # keys or integer codes
4 seq2 = build(seq1, sequence.ITALIC) # existing SGRs
5 seq3 = build('underlined', 'YELLOW') # case-insensitive
6
7 msg = f'{seq1}Flexible{sequence.RESET} ' + \
8       f'{seq2}sequence{sequence.RESET} ' + \
9       str(seq3) + 'builder' + str(sequence.RESET)
10 print(msg)
```

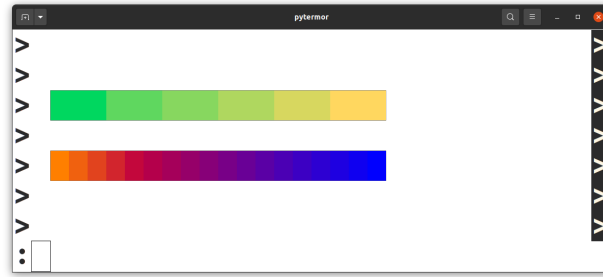

256 colors / True Color support

The library supports extended color modes:

- XTerm 256 colors indexed mode (see *Preset list*);
- True Color RGB mode (16M colors).

```
1 from pytermor import color_indexed, color_rgb, sequence
2
3 start_color = 41
4 for idx, c in enumerate(range(start_color, start_color+(36*6), 36)):
5     print(f'{color_indexed(c)}{sequence.COLOR_OFF}', end='')
6
7 print('\n')
8 for idx, c in enumerate(range(0, 256, 256//17)):
9     r = max(0, 255-c)
10    g = max(0, min(255, 127-(c*2)))
11    b = c
12    print(f'{color_rgb(r, g, b)}{sequence.COLOR_OFF}', end='')

```

Customizable output formats

@TODO

String and number formatters

@TODO

1.2 High-level abstractions

1.2.1 Colors and Styles

1.2.2 Output format control

1.2.3 Color mode fallbacks

Fig. 1: Color approximations for indexed modes

1.2.4 Core API

@EXAMPLES

1.3 Low-level abstractions

So, what's happening under the hood?

1.3.1 Format soft reset

There are two ways to manage color and attribute termination:

- hard reset (SGR-0 or `e[0m`)
- soft reset (SGR-22, 23, 24 etc.)

The main difference between them is that *hard* reset disables all formatting after itself, while *soft* reset disables only actually necessary attributes (i.e. used as opening sequence in `Span` instance's context) and keeps the other.

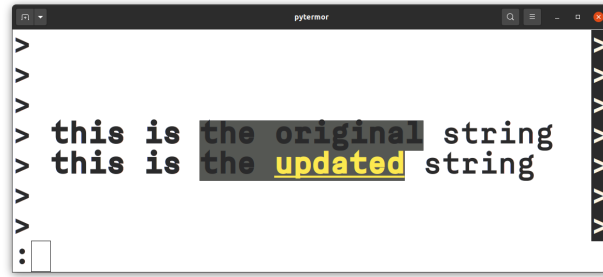

That's what `Span` class is designed for: to simplify creation of soft-resetting text spans, so that developer doesn't have to restore all previously applied formats after every closing sequence.

Example

We are given a text span which is initially *bold* and *underlined*. We want to recolor a few words inside of this span. By default this will result in losing all the formatting to the right of updated text span (because `RESET`, or `e[0m`, clears all text attributes).

However, there is an option to specify what attributes should be disabled or let the library do that for you:

```
1 from pytermor import sequence, span, Span
2
3 # implicitly:
4 span_warn = Span(93, 4)
5 # or explicitly:
6 span_warn = Span.from_seq(
7     sequence.HI_YELLOW + sequence.UNDERLINED, # sequences can be summed up, remember?
8     sequence.COLOR_OFF + sequence.UNDERLINED_OFF, # "counteractive" sequences
9     hard_reset_after=False
10 )
11
12 orig_text = span.BOLD(f'this is {sequence.BG_GRAY}the original{sequence.RESET} string')
13 updated_text = orig_text.replace('original', span_warn('updated'), 1)
14 print(orig_text, '\n', updated_text)
```

As you can see, the update went well – we kept all the previously applied formatting. Of course, this method cannot be 100% applicable; for example, imagine that original text was colored blue. After the update “string” word won’t be blue anymore, as we used `sequence.COLOR_OFF` escape sequence to neutralize our own yellow color. But it still can be helpful for a majority of cases (especially when text is generated and formatted by the same program and in one go).

1.3.2 Working with Spans

Use *Span* constructor to create new instance with specified control sequence(s) as a opening/starter sequence and **automatically composed** closing sequence that will terminate attributes defined in opening sequence while keeping the others (soft reset).

Resulting sequence params’ order is the same as argument’s order.

Each sequence param can be specified as:

- string key (see *Preset list*);
- integer param value;
- existing *SequenceSGR* instance (params will be extracted).

It’s also possible to avoid auto-composing mechanism and create *Span* with explicitly set parameters using *Span.from_seq()*.

1.3.3 Creating and applying SGRs

You can use any of predefined sequences from *sequence* or create your own via standard constructor. Valid argument values as well as preset constants are described in *Preset list* page.

There is also a set of methods for dynamic *SequenceSGR* creation:

- *build()* for non-specific sequences;

Important: *SequenceSGR* with zero params was specifically implemented to translate into an empty string and not into `e[m`, which would make sense, but also could be very entangling, as terminal emulators interpret that sequence as `e[Om`, which is *hard* reset sequence.

- *color_indexed()* for complex color selection sequences operating in 256-colors mode (for a complete list see *Preset list*);
- *color_rgb()* for setting the colors in True Color 16M mode (however, some terminal emulators doesn’t support it).

To get the resulting sequence chars use *encode()* method or cast instance to *str*.

```
1 from pytermor.sequence import SequenceSGR
2
3 seq = SequenceSGR(4, 7)
4 msg = f'({seq})'
5
6 print(msg + f'({SequenceSGR(0).encode()})')
7 print(str(msg.encode()))
8 print(msg.encode().hex(':'))
```

- First line is the string with encoded escape sequence;
- Second line shows up the string in raw mode, as if sequences were ignored by the terminal;
- Third line is hexademical string representation.

1.3.4 SGR sequence structure

1. `\x1b` is *ESC control character*, which opens a control sequence.
2. `[` is sequence *introducer*; it determines the type of control sequence (in this case it's CSI (Control Sequence Introducer)).
3. `4` and `7` are *parameters* of the escape sequence; they mean “underlined” and “inversed” attributes respectively. Those parameters must be separated by `;`.
4. `m` is sequence *terminator*; it also determines the sub-type of sequence, in our case SGR. Sequences of this kind are most commonly encountered.

1.3.5 Combining SGRs

One instance of `SequenceSGR` can be added to another. This will result in a new `SequenceSGR` with combined params.

```
1 from pytermor import sequence
2 from pytermor.sequence import SequenceSGR
3
4 combined = SequenceSGR(1, 31) + SequenceSGR(4)
5 print(f'{{combined}}combined{{sequence.RESET}}', str(combined).encode())
```

1.3.6 Core API

- @TODO
- *Span* constructor
- *Span.from_seq()*

1.4 Preset list

Preset lists are omitted from API docs to avoid unnecessary duplication; summary list of all presets defined in the library (not including *util.**) is displayed here.

@TODO USAGE - list all memthods that accept string keys of those prsets.

There are two types of color palettes used in modern terminals – first one containing 16 colors (library references that palette as *default*, see *ColorDefault*), and second one consisting of 256 colors (referenced as *indexed*, e.g. *ColorIndexed*). There is also True Color mode (referenced as *RGB* mode), but it is not palette-based.

Legend

- INT (intcode module -- 1st or 3rd SGR param value)
- SEQ (sequence module)
- SPN (span module)
- CLR (color module)
- STY (style module)

1.4.1 Meta, attributes, breakers

	Name	INT	SEQ	SPN	CLR	STY	Description
Meta							
	NOOP		V	V	V	V	No-operation; always encoded as empty string
	RESET	0	V				Reset all attributes and colors
Attributes							
	BOLD	1	V	V		V ¹	Bold or increased intensity
	DIM	2	V	V		V	Faint, decreased intensity
	ITALIC	3	V	V		V	Italic; <i>not widely supported</i>
	UNDERLINED	4	V	V		V	Underline
	BLINK_SLOW	5	V			V ²	Set blinking to < 150 cpm
	BLINK_FAST	6	V				Set blinking to 150+ cpm; <i>not widely supported</i>
	INVERSED	7	V	V		V	Swap foreground and background colors
	HIDDEN	8	V				Conceal characters; <i>not widely supported</i>
	CROSSLINED	9	V			V	Strikethrough
	DOUBLE_UNDERLINED	21	V				Double-underline; <i>on several terminals disables BOLD instead</i>
	COLOR_EXTENDED	38					Set foreground color [<i>indexed/RGB mode</i>]; use color_indexed and color_rgb instead
	BG_COLOR_EXTENDED	48					Set background color [<i>indexed/RGB mode</i>]; use color_indexed and color_rgb instead
	OVERLINED	53	V	V		V	Overline; <i>not widely supported</i>
Breakers							
	BOLD_DIM_OFF	22	V				Disable BOLD and DIM attributes. <i>Special aspects... It's impossible to reliably disable them on a separate basis.</i>
	ITALIC_OFF	23	V				Disable italic
	UNDERLINED_OFF	24	V				Disable underlining
	BLINK_OFF	25	V				Disable blinking
	INVERSED_OFF	27	V				Disable inversing
	HIDDEN_OFF	28	V				Disable concealing
	CROSSLINED_OFF	29	V				Disable strikethrough
	COLOR_OFF	39	V				Reset foreground color
	BG_COLOR_OFF	49	V				Reset background color
	OVERLINED_OFF	55	V				Disable overlining

¹ for this and subsequent items in “Attributes” section: as boolean flags.

² as `blink`.

1.4.2 Default colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
Foreground default colors								
	BLACK	30	V	V	V		#000000	Black
	RED	31	V	V	V		#800000	Maroon
	GREEN	32	V	V	V		#008000	Green
	YELLOW	33	V	V	V		#808000	Olive
	BLUE	34	V	V	V		#000080	Navy
	MAGENTA	35	V	V	V		#800080	Purple
	CYAN	36	V	V	V		#008080	Teal
	WHITE	37	V	V	V		#c0c0c0	Silver
Background default colors								
	BG_BLACK	40	V	V	V		#000000	Black
	BG_RED	41	V	V	V		#800000	Maroon
	BG_GREEN	42	V	V	V		#008000	Green
	BG_YELLOW	43	V	V	V		#808000	Olive
	BG_BLUE	44	V	V	V		#000080	Navy
	BG_MAGENTA	45	V	V	V		#800080	Purple
	BG_CYAN	46	V	V	V		#008080	Teal
	BG_WHITE	47	V	V	V		#c0c0c0	Silver
High-intensity foreground default colors								
	GRAY	90	V	V	V		#808080	Grey
	HI_RED	91	V	V	V		#ff0000	Red
	HI_GREEN	92	V	V	V		#00ff00	Lime
	HI_YELLOW	93	V	V	V		#ffff00	Yellow
	HI_BLUE	94	V	V	V		#0000ff	Blue
	HI_MAGENTA	95	V	V	V		#ff00ff	Fuchsia
	HI_CYAN	96	V	V	V		#00ffff	Aqua
	HI_WHITE	97	V	V	V		#ffffff	White
High-intensity background default colors								
	BG_GRAY	100	V	V	V		#808080	Grey
	BG_HI_RED	101	V	V	V		#ff0000	Red
	BG_HI_GREEN	102	V	V	V		#00ff00	Lime
	BG_HI_YELLOW	103	V	V	V		#ffff00	Yellow
	BG_HI_BLUE	104	V	V	V		#0000ff	Blue
	BG_HI_MAGENTA	105	V	V	V		#ff00ff	Fuchsia
	BG_HI_CYAN	106	V	V	V		#00ffff	Aqua
	BG_HI_WHITE	107	V	V	V		#ffffff	White

1.4.3 Indexed colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
	IDX_BLACK ³	0			V		#000000	Black
	IDX_MAROON	1			V		#800000	Maroon
	IDX_GREEN	2			V		#008000	Green
	IDX_OLIVE	3			V		#808000	Olive
	IDX_NAVY	4			V		#000080	Navy
	IDX_PURPLE	5			V		#800080	Purple
	IDX_TEAL	6			V		#008080	Teal
	IDX_SILVER	7			V		#c0c0c0	Silver
	IDX_GRAY	8			V		#808080	Grey
	IDX_RED	9			V		#ff0000	Red
	IDX_LIME	10			V		#00ff00	Lime
	IDX_YELLOW	11			V		#ffff00	Yellow
	IDX_BLUE	12			V		#0000ff	Blue
	IDX_FUCHSIA	13			V		#ff00ff	Fuchsia
	IDX_AQUA	14			V		#00ffff	Aqua
	IDX_WHITE	15			V		#ffffff	White
	IDX_GREY_0	16			V		#000000	Grey0
	IDX_NAVY_BLUE	17			V		#00005f	NavyBlue
	IDX_DARK_BLUE	18			V		#000087	DarkBlue
	IDX_BLUE_3	19			V		#0000af	Blue3
	IDX_BLUE_2	20			V		#0000d7	Blue3 ⁴
	IDX_BLUE_1	21			V		#0000ff	Blue1
	IDX_DARK_GREEN	22			V		#005f00	DarkGreen
	IDX_DEEP_SKY_BLUE_4	23			V		#005f5f	DeepSkyBlue4
	IDX_DEEP_SKY_BLUE_4	24			V		#005f87	DeepSkyBlue4

1.5 Color palette

Actual colors of *default* palette depend on user's terminal settings, i.e. the result color of `ColorDefault` is not guaranteed to exactly match the corresponding color listed below. What's more, note that *default* palette is actually a part of *indexed* one (first 16 colors of 256-color table).

Important: @TODO The approximation algorithm was explicitly made to ignore these colors because otherwise the results of transforming *RGB* values into *indexed* ones would be unpredictable, in addition to different results for different users, depending on their terminal emulator setup.

However, it doesn't mean that `ColorDefault` is useless. Just the opposite – it's ideal for situations when you don't actually **have to** set exact values and it's easier to specify estimation of desired color. I.e. setting color to 'red' is usually more than enough for displaying an error message – we don't really care of precise hue or brightness values for it.

Approximation algorithm is as simple as iterating through all colors in the *lookup table* (which contains all possible ... @TODO finish

³ First 16 colors are effectively the same as colors in *default* 16-color mode and share with them the same color values (and depend on terminal color scheme as well).

⁴ XTerm name list contains duplicates; variable names for these were slightly modified (different numbers at the end) to avoid namespace conflicts. All non-matching names are displayed using **bold** font.

1.6 Formatters and Filters

The library contains @TODO

1.6.1 Auto-float formatter

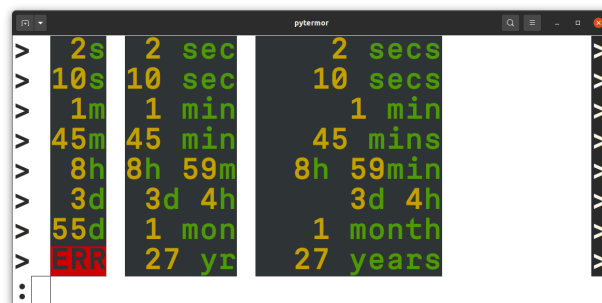

1.6.2 Prefixed-unit formatter

1.6.3 Time delta formatter

```

1 from pytermor import Style, color, ColorRGB
2 from pytermor import renderer
3 from pytermor.util import time_delta
4
5 seconds_list = [2, 10, 60, 2700, 32340, 273600, 4752000, 864000000]
6 max_len_list = [3, 6, 10]
7
8 custom_stylesheet = time_delta.TimeDeltaStylesheet(
9     default=Style(bg_color=0x202028),
10    digit=Style(0x3333000, 'yellow'),
11    unit=Style(fg_color='green', bg_color=0x202028, underlined=True),
12    overflow=Style(fg_color=color.BLACK, bg_color='hi_red', bold=True),
13 )
14 for max_len in max_len_list:
15     formatter = time_delta.registry.find_matching(max_len)
16     formatter.stylesheet = custom_stylesheet
17
18 renderer.SGRRenderer.set_as_default()
19 for seconds in seconds_list:
20     for max_len in max_len_list:
21         formatter = time_delta.registry.get_by_max_len(max_len)
22         print(formatter.format(seconds, True), end=' ')
23 print()

```

1.6.4 String filters

1.6.5 Standard Library extensions

@TODO

2.1 color

@TODO

@TODO black/white text selection depending on bg

class pytermor.color.Color

Abstract superclass for other Colors.

__init__(*hex_value: Optional[int] = None*)

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms *hex_value* in 0xffffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms *hex_value* in 0xffffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

abstract classmethod get_default() → *Color*

Returns

Fallback instance of *Color* inheritor (if registries are empty).

abstract classmethod find_closest(*hex_value: int*) → *Color*

Wrapper for *_ColorMap.find_closest()*.

Parameters

hex_value – Integer color value in 0xffffffff format.

Returns

Nearest found color of specified type.

abstract to_sgr(*bg: bool = False*) → *SequenceSGR*

property hex_value: int | None

format_value(*prefix: str | None = '0x'*) → str

class pytermor.color.ColorDefault

Bases: [Color](#)

__init__(*hex_value: int, code_fg: int, code_bg: int*)

classmethod get_default() → [ColorDefault](#)

Returns

Fallback instance of [Color](#) inheritor (if registries are empty).

classmethod find_closest(*hex_value: int*) → [ColorDefault](#)

Wrapper for [_ColorMap.find_closest\(\)](#).

Attention: Use this method only if you know what you are doing. *Default* mode colors may vary in a huge range depending on user terminal setup (colors even can have exactly the opposite value of what's listed in preset list). Much more reliable and predictable approach is to use [ColorIndexed.find_closest](#) instead.

Parameters

hex_value – Integer color value in 0xffffffff format.

Returns

Nearest found [ColorDefault](#) instance.

```
>>> ColorDefault.find_closest(0x660000)
ColorDefault[fg=31, bg=41, 0x800000]
```

to_sgr(*bg: bool = False*) → [SequenceSGR](#)

format_value(*prefix: str | None = '0x'*) → str

property hex_value: int | None

static hex_value_to_hsv_channels(*hex_value: int*) → Tuple[int, float, float]

Transforms *hex_value* in 0xffffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static hex_value_to_rgb_channels(*hex_value: int*) → Tuple[int, int, int]

Transforms *hex_value* in 0xffffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

class pytermor.color.ColorIndexed

Bases: [Color](#)

__init__(*hex_value: int, code: int*)

classmethod `get_default()` → *ColorIndexed*

Returns

Fallback instance of *Color* inheritor (if registries are empty).

classmethod `find_closest(hex_value: int)` → *ColorIndexed*

Wrapper for *_ColorMap.find_closest()*.

Note: Approximation algorithm ignores colors 000-015 from the *indexed* palette and will return colors with int codes in 016-255 range only. The reason for this is the same as for discouraging the usage of *ColorDefault* method version – because aforementioned colors actually depend on end-user terminal settings and the final result can be differ drastically from what's the developer imagined.

Parameters

hex_value – Integer color value in `0xffffffff` format.

Returns

Nearest found *ColorIndexed* instance.

```
>>> ColorIndexed.find_closest(0xd9dbdb)
ColorIndexed[code=253, 0xdadada]
```

to_sgr(*bg: bool = False*) → *SequenceSGR*

format_value(*prefix: str | None = '0x'*) → *str*

property `hex_value: int | None`

static `hex_value_to_hsv_channels(hex_value: int)` → *Tuple[int, float, float]*

Transforms `hex_value` in `0xffffffff` format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static `hex_value_to_rgb_channels(hex_value: int)` → *Tuple[int, int, int]*

Transforms `hex_value` in `0xffffffff` format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

class `pytermor.color.ColorRGB`

Bases: *Color*

classmethod `get_default()` → *ColorRGB*

Returns

Fallback instance of *Color* inheritor (if registries are empty).

classmethod `find_closest(hex_value: int)` → *ColorRGB*

In case of *ColorRGB* we suppose that user's terminal is not limited to a palette, therefore RGB-type color map works by simplified algorithm – it just checks if instance with same hex value was already created and returns it if that's the case, or returns a brand new instance with specified color value otherwise.

Parameters

hex_value – Integer color value in 0xffffffff format.

Returns

Existing *ColorRGB* instance or newly created one.

```
>>> existing_color1 = ColorRGB(0x660000)
>>> existing_color2 = ColorRGB(0x660000)
>>> existing_color1 == existing_color2
True
>>> existing_color1 is existing_color2 # different instances
False
>>> existing_color1 == ColorRGB.find_closest(0x660000)
True
>>> existing_color1 is ColorRGB.find_closest(0x660000) # same instance
True
```

to_sgr(bg: bool = False) → *SequenceSGR*

__init__(hex_value: Optional[int] = None)

format_value(prefix: str | None = '0x') → str

property hex_value: int | None

static hex_value_to_hsv_channels(hex_value: int) → Tuple[int, float, float]

Transforms hex_value in 0xffffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static hex_value_to_rgb_channels(hex_value: int) → Tuple[int, int, int]

Transforms hex_value in 0xffffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

pytermor.color.TypeColor

Any non-abstract *Color* type.

alias of TypeVar('TypeColor', ColorDefault, ColorIndexed, ColorRGB)

class pytermor.color._ColorMap

Bases: Generic[*TypeColor*]

Class contains a dictionary of registered *Colors* indexed by hex code along with cached nearest color search results to avoid unnecessary instance copies and search repeating.

__init__(parent_type: *TypeColor*)

Called in *Color*-type class constructors. Each *Color* type should have class variable with instance of *_ColorMap* and create it by itself if it's not present.

Parameters

parent_type – Parent *Color* type.

add_to_map(*color: TypeColor*)

Called in *Color*-type class constructors. Add a new element in color lookup table if it wasn't there, and then drop cached search results as they are most probably useless after registering a new color (i.e. now there will be better result for at least one cached value).

Parameters

color – *Color* instance being created.

get_exact(*hex_value: int*) → TypeColor | None

Public interface for searching exact values in the *lookup table*, or global registry of created instances of specified *Color* class.

Parameters

hex_value – Color value in RGB format.

Returns

Color with specified value. Type is equal to type of the parent of selected color map.

find_closest(*hex_value: int*) → TypeColor

Search for nearest to *hex_value* registered color. Is used by *SGRRenderer* to find supported color alternatives in case user's terminal is incapable of operating in better mode.

Parameters

hex_value – Color value in RGB format.

Returns

Nearest to *hex_value* registered *Color*. Type is equal to type of the parent of selected color map. If no colors of required type were created (table and cache are empty), invokes *get_default()* *Color* method.

approximate(*hex_value: int, max_results: int = 1*) → List[TypeColor]

Core color approximation method. Iterate the registered SGRs table, or *lookup table*, containing parents' instances, and compute the euclidean distance from argument to each color of the palette. Sort the results and return the first <max_results> of them.

Note: It's not guaranteed that this method will **always** succeed in searching (the result list can be empty). Consider using *find_closest* instead, if you really want to be sure that at least some color will be returned. Another option is to use special "color" named *NOOP*.

Parameters

- **hex_value** – Color RGB value.
- **max_results** – Maximum amount of values to return.

Returns

Closest *Color* instances found, sorted by color distance descending (i.e. 0th element is always the closest to the input value).

static __new__(*cls, *args, **kws*)

pytermor.color.NOOP = ColorRGB[]

Special instance of *Color* class always rendering into empty string.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Preset list* section of the guide.

2.2 intcode

Module with SGR param integer codes, contains a complete or almost complete list of reliably working ones.

Suitable for *Span* and *SequenceSGR* default constructors.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in *Preset list* section of the guide.

2.3 renderer

Module with output formatters. By default *SGRRenderer* is used.

Abstract parent class *Renderer* contains global (library-wide) compatibility settings. See *Renderer.set_up()*.

Working with non-default renderer can be accomplished in two ways:

- a. There is a module-level variable *DefaultRenderer* determining what renderer *Style.render()* method will be using. Default renderer can be swapped with another one using *Renderer.set_as_default()* class method of the latter.
- b. Alternatively, you can use renderer's own class method *Renderer.render()* directly and avoid calling *Style.render()* method whatsoever.

```
>>> Renderer.set_up(True)
>>> DebugRenderer.set_as_default()
>>> Style('red').render('_text_')
'[31m_text_[39m'
>>> NoOpRenderer.render(Style('red'), 'text')
'text'
```

class pytermor.renderer.*Renderer*

Abstract parent of all other renderers. Among other things also contains settings shared between all renderer types that can be customized by developer at runtime.

static set_up(*force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_indexed` will be ignored completely. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

classmethod `set_as_default()`

Set renderer as default for `Style.render()` invocations.

abstract classmethod `render(style: Style, text: str) → str`

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

class `pytermor.renderer.SGRRenderer`

Bases: `Renderer`

Default renderer that `Style.render()` invokes. Transforms `Color` instances defined in `style` argument into ANSI control sequence characters and merges them with input string.

classmethod `render(style: Style, text: str)`

Render `text` with `style` applied as ANSI control sequences.

Respects compatibility preferences (see `set_up()`) and maps RGB colors to closest *indexed* colors if terminal doesn't support RGB output. In case terminal doesn't support even 256 colors, falls back to *default* colors, searching for closest counterparts in 16-color table.

Type of output `SequenceSGR` depends on type of `Color` variables in `style` argument. Keeping all that in mind, let's summarize:

1. `ColorRGB` can be rendered as True Color sequence, indexed sequence and default (16-color) sequence depending on terminal capabilities.
2. `ColorIndexed` can be rendered as indexed sequence or default sequence.
3. `ColorDefault` will be rendered as default-color sequence.

Parameters

- **style** – Style to apply.
- **text** – Input string.

Returns

Input string enclosed in SGR sequences.

classmethod `set_as_default()`

Set renderer as default for `Style.render()` invocations.

static `set_up(force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False)`

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.

- If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of **compatibility_indexed** will be ignored completely. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.TmuxRenderer

Bases: [Renderer](#)

abstractmethod **render**(*style: Style, text: str*) → str

Apply colors and attributes described in *style* argument to *text* and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod **set_as_default**()

Set renderer as default for [Style.render\(\)](#) invocations.

static **set_up**(*force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of **compatibility_indexed** will be ignored completely. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.NoOpRenderer

Bases: [Renderer](#)

classmethod **render**(*style: Style, text: str*) → str

Special renderer type that does nothing with the input string and just returns it as is.

```
>>> NoOpRenderer.render(Style(0xff00ff), 'text')
'text'
```

Parameters

- **style** – Style to ignore.
- **text** – Input string.

Returns

Input string without changes.

classmethod set_as_default()

Set renderer as default for `Style.render()` invocations.

static set_up(*force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of *compatibility_indexed* will be ignored completely. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.HtmlRenderer

Bases: `Renderer`

classmethod render(*style: Style, text: str*) → str

Apply colors and attributes described in *style* argument to *text* and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod set_as_default()

Set renderer as default for `Style.render()` invocations.

static set_up(*force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).

- If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
- If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of **compatibility_indexed** will be ignored completely. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

class pytermor.renderer.DebugRenderer

Bases: [Renderer](#)

classmethod **render**(*style: Style, text: str*) → str

Apply colors and attributes described in *style* argument to *text* and return the result. Output format depends on renderer's class (which defines the implementation).

classmethod **set_as_default**()

Set renderer as default for [Style.render\(\)](#) invocations.

static **set_up**(*force_styles: bool | None = False, compatibility_indexed: bool = False, compatibility_default: bool = False*)

Set up renderer preferences. Affects all renderer types.

Parameters

- **force_styles** –
 - If set to *None*, all renderers will pass input text through themselves without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderers will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_indexed** – Disable *RGB* (or True Color) output mode. 256-color (*indexed*) sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_default** – Disable *indexed* output mode and use *default* 16-color sequences instead. If this setting is set to *True*, the value of **compatibility_indexed** will be ignored completely. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.

pytermor.renderer.DefaultRenderer

alias of [SGRRenderer](#)

2.4 sequence

Module contains definitions for low-level ANSI escape sequences handling.

Each preset defined below is a valid argument for *Span* and *SequenceSGR* default constructors (case-insensitive):

```
Span(sequence.BG_GREEN, sequence.UNDERLINED)
```

`pytermor.sequence.build(*args: str | int | SequenceSGR) → SequenceSGR`

Create new *SequenceSGR* with specified args as params.

Resulting sequence param order is same as an argument order.

Each sequence param can be specified as:

- string key (see *span*)
- integer param value (from *intcode*)
- existing *SequenceSGR* instance (params will be extracted).

Deprecated since version 2.0: @TODO ,

Examples:

```
>>> build('yellow', 'bold')
SGR[33;1]
>>> build(91, 7)
SGR[91;7]
>>> build(HI_CYAN, UNDERLINED)
SGR[96;4]
```

`pytermor.sequence.color_indexed(color: int, bg: bool = False) → SequenceSGR`

Wrapper for creation of *SequenceSGR* that sets foreground (or background) to one of 256-color palette value.

Deprecated since version 2.0: @TODO

Parameters

- **color** – Index of the color in the palette, 0 – 255.
- **bg** – Set to *True* to change the background color (default is foreground).

Returns

SequenceSGR with required params.

`pytermor.sequence.color_rgb(r: int, g: int, b: int, bg: bool = False) → SequenceSGR`

Wrapper for creation of *SequenceSGR* operating in True Color mode (16M). Valid values for *r*, *g* and *b* are in range [0; 255]. This range linearly translates into [0x00; 0xFF] for each channel. The result value is composed as #RRGGBB. For example, sequence with color of #FF3300 can be created with:

```
color_rgb(255, 51, 0)
```

Deprecated since version 2.0: @TODO

Parameters

- **r** – Red channel value, 0 – 255.
- **g** – Blue channel value, 0 – 255.
- **b** – Green channel value, 0 – 255.

- **bg** – Set to *True* to change the background color (default is foreground).

Returns

[SequenceSGR](#) with required params.

class `pytermor.sequence.SequenceSGR`

Bases: `_SequenceCSI`

Class representing SGR-type escape sequence with varying amount of parameters.

[SequenceSGR](#) with zero params was specifically implemented to translate into empty string and not into `e[m`, which would have made sense, but also would be very entangling, as this sequence is equivalent of `e[0m` – hard reset sequence. The empty-string-sequence is predefined as [NOOP](#).

It's possible to add of one SGR sequence to another:

```
>>> SequenceSGR(31) + SequenceSGR(1) == SequenceSGR(31, 1)
True
```

encode() → str

Build up actual byte sequence and return as an ASCII-encoded string.

__init__(*params: int)

property `params: List[int]`

Return internal params as array.

classmethod `regexp()` → str

`pytermor.sequence.NOOP = SGR[]`

Special sequence in case where you *have to* provide one or another SGR, but do not want any control sequence to be actually included.

- `NOOP.encode()` returns empty string.
- `NOOP.params` returns empty list.

```
>>> NOOP.encode()
''
>>> NOOP.params
[]
```

New in version 1.8.

`pytermor.sequence.RESET = SGR[0]`

Resets all attributes and colors.

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [Preset list](#) section of the guide.

2.5 span

Module introducing *Span* low-level abstractions. The key difference between them and Sequences is that sequence can *open* text style and also *close*, or terminate it. As for Spans – they always do both; typical use-case of *Span* is to wrap some text in opening SGR and closing one.

class pytermor.span.Span

Create a *Span* with specified control sequence(s) as an opening sequence and **automatically compose** second (closing) sequence that will terminate attributes defined in the first one while keeping the others (*soft* reset).

Resulting sequence param order is same as an argument order.

Each argument can be specified as:

- string key (name of any constant defined in *intcode*, case-insensitive)
- integer param value (defined in *intcode*)
- existing *SequenceSGR* instance (params will be extracted).

```
>>> Span('red', 'bold')
Span[SGR[31;1], SGR[39;22]]
>>> Span(intcode.GREEN)
Span[SGR[32], SGR[39]]
>>> Span(93, 4)
Span[SGR[93;4], SGR[39;24]]
>>> Span(sequence.BG_BLACK + sequence.RED)
Span[SGR[40;31], SGR[49;39]]
```

Parameters

opening_params – string keys, integer codes or existing *SequenceSGR* instances to build *Span* from.

__init__(*opening_params: str | int | *SequenceSGR*)

classmethod from_seq(opening_seq: Optional[*SequenceSGR*] = None, closing_seq: Optional[*SequenceSGR*] = None, hard_reset_after: bool = False) → *Span*

Create new *Span* with explicitly specified opening and closing sequences.

Note: *closing_seq* gets overwritten with *sequence.RESET* if *hard_reset_after* is *True*.

Parameters

- **opening_seq** – Starter sequence, in general determining how *Span* will actually look like.
- **closing_seq** – Finisher SGR sequence.
- **hard_reset_after** – Terminate *all* formatting after this span.

wrap(text: Optional[Any] = None) → str

Wrap given text string with SGRs defined on initialization – *opening_seq* on the left, *closing_seq* on the right. *str(text)* will be invoked for all argument types with the exception of *None*, which will be replaced with an empty string.

Parameters

text – String to wrap.

Returns

text enclosed in instance's SGRs, if any.

property opening_str: str

Return opening SGR sequence encoded.

property opening_seq: [SequenceSGR](#)

Return opening SGR sequence instance.

property closing_str: str

Return closing SGR sequence encoded.

property closing_seq: [SequenceSGR](#)

Return closing SGR sequence instance.

__call__(text: *Optional[Any]* = None) → str

Can be used instead of [wrap\(\)](#) method.

```
>>> RED('text') == RED.wrap('text')
True
```

`pytermor.span.NOOP = Span[SGR[], SGR[]]`

Special [Span](#) in cases where you *have to* select one or another [Span](#), but do not want any control sequence to be actually included.

- `NOOP(string)` or `NOOP.wrap(string)` returns string without any modifications;
- `NOOP.opening_str` and `NOOP.closing_str` are empty strings;
- `NOOP.opening_seq` and `NOOP.closing_seq` both returns [sequence.NOOP](#).

```
>>> NOOP('text')
'text'
>>> NOOP.opening_str
''
>>> NOOP.opening_seq
SGR[]
```

Attention: Preset constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [Preset list](#) section of the guide.

2.6 style

High-level abstraction defining text colors and attributes.

class `pytermor.style.Style`

Create a new `Style()`.

Key difference between Styles and Spans or SGRs is that Styles describe colors in RGB format and therefore support output rendering in several different formats (see [renderer](#)).

Both `fg_color` and `bg_color` can be specified as:

1. [Color](#) instance or library preset;
2. key code – name of any of aforementioned presets, case-insensitive;

3. integer color value in hexademical RGB format.

```
>>> Style('green', bold=True)
Style[fg=008000, no bg, bold]
>>> Style(bg_color=0x0000ff)
Style[no fg, bg=0000ff]
>>> Style(color.IDX_DEEP_SKY_BLUE_1, color.IDX_GREY_93)
Style[fg=00afff, bg=eeeeee]
```

Parameters

- **fg_color** – Foreground (i.e., text) color.
- **bg_color** – Background color.
- **auto_fg** – Automatically select **fg_color** based on **bg_color** (black or white depending on background brightness, if **bg_color** is defined).
- **blink** – Blinking effect; *supported by limited amount of Renderers*.
- **bold** – Bold or increased intensity.
- **crosslined** – Strikethrough.
- **dim** – Faint, decreased intensity.
- **double_underlined** – Faint, decreased intensity.
- **inversed** – Swap foreground and background colors.
- **italic** – Italic.
- **overlined** – Overline.
- **underlined** – Underline.

```
__init__(fg_color: str | int | Color = None, bg_color: str | int | Color = None, auto_fg: bool = False, blink: bool = False, bold: bool = False, crosslined: bool = False, dim: bool = False, double_underlined: bool = False, inversed: bool = False, italic: bool = False, overlined: bool = False, underlined: bool = False)
```

```
render(text: Optional[Any] = None) → str
```

Returns text with all attributes and colors applied.

By default uses [SequenceSGR](#) renderer, that means that output will contain ANSI escape sequences.

```
class pytermor.style.Stylesheet
```

```
__init__(default: Optional[Style] = None)
```

2.7 util

Package containing a set of formatters for prettier output, as well as utility classes for removing some of the boilerplate code when dealing with escape sequences.

```
pytermor.util.format_thousand_sep(value: int | float, separator=' ')
```

Returns input value with integer part splitted into groups of three digits, joined then with **separator** string.

```
>>> format_thousand_sep(260341)
'260 341'
>>> format_thousand_sep(-9123123123.55, ',')
'-9,123,123,123.55'
```

2.7.1 auto_float

`pytermor.util.auto_float.format_auto_float(value: float, req_len: int, allow_exponent_notation: bool = True) → str`

Dynamically adjust decimal digit amount and format to fill up the output string with as many significant digits as possible, and keep the output length strictly equal to `req_len` at the same time.

```
>>> format_auto_float(0.016789, 5)
'0.017'
>>> format_auto_float(0.167891, 5)
'0.168'
>>> format_auto_float(1.567891, 5)
'1.568'
>>> format_auto_float(12.56789, 5)
'12.57'
>>> format_auto_float(123.5678, 5)
'123.6'
>>> format_auto_float(1234.567, 5)
'1235'
>>> format_auto_float(12345.67, 5)
'12346'
```

For cases when it's impossible to fit a number in the required length and rounding doesn't help (e.g. 12 500 000 and 5 chars) algorithm switches to scientific notation and the result looks like '1.2e7'.

When exponent form is disabled, there are two options for value that cannot fit into required length:

- 1) if absolute value is less than 1, zeros will be displayed ('0.0000');
- 2) in case of big numbers (like 10^9) `ValueError` will be raised instead.

Parameters

- **value** – Value to format
- **req_len** – Required output string length
- **allow_exponent_notation** – Enable/disable exponent form.

Returns

Formatted string of required length

Raises

ValueError –

New in version 1.7.

2.7.2 prefixed_unit

`pytermor.util.prefixed_unit.format_si_metric(value: float) → str`

Format value as unitless value with SI-prefixes, max result length is 6 chars. Base is 1000.

```
>>> format_si_metric(123.456)
'123'
>>> format_si_metric(1080)
'1.08 k'
>>> format_si_metric(45200)
'45.2 k'
>>> format_si_metric(1257800)
'1.26 M'
```

Parameters

value – Input value (unitless).

Returns

Formatted string with SI-prefix if necessary.

New in version 2.0.

`pytermor.util.prefixed_unit.format_si_binary(value: float) → str`

Format value as binary size (bytes, kbytes, Mbytes), max result length is 8 chars. Base is 1024.

```
>>> format_si_binary(631)
'631 b'
>>> format_si_binary(1080)
'1.055 kb'
>>> format_si_binary(45200)
'44.14 kb'
>>> format_si_binary(1257800)
'1.200 Mb'
```

Parameters

value – Input value in bytes.

Returns

Formatted string with SI-prefix if necessary.

New in version 2.0.

class `pytermor.util.prefixed_unit.PrefixedUnitFormatter`

Formats value using settings passed to constructor. The main idea of this class is to fit into specified string length as much significant digits as it's theoretically possible by using multipliers and unit prefixes to indicate them.

You can create your own formatters if you need fine tuning of the output and customization. If that's not the case, there are facade methods `format_si_metric()` and `format_si_binary()`, which will invoke predefined formatters and doesn't require setting up.

@TODO params

Parameters

prefix_zero_idx – Index of prefix which will be used as default, i.e. without multiplying coefficients.

New in version 1.7.

```
__init__(max_value_len: int, integer_input: bool = False, unit: str = None, unit_separator: str = None,
          mcoef: float = 1000.0, prefixes: List[str | None] = None, prefix_zero_idx: int = None)
```

property max_len: int

Returns

Maximum length of the result. Note that constructor argument is *max_value_len*, which is different parameter.

format(value: float) → str

Parameters

value – Input value

Returns

Formatted value

`pytermor.util.prefixed_unit.PREFIXES_SI = ['y', 'z', 'a', 'f', 'p', 'n', '', 'm', None, 'k', 'M', 'G', 'T', 'P', 'E', 'Z', 'Y']`

Prefix presets used by default module formatters. Can be useful if you are building your own formatter.

`pytermor.util.prefixed_unit.PREFIX_ZERO_SI = 8`

Index of prefix which will be used as default, i.e. without multiplying coefficients.

2.7.3 time_delta

Module for time difference formatting (e.g. “4 days 15 hours”, “8h 59m”).

Supports several output lengths and can be customized even more.

`pytermor.util.time_delta.format_time_delta(seconds: float, max_len: Optional[int] = None) → str`

Format time delta using suitable format (which depends on *max_len* argument). Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”,

There are predefined formatters with output length of 3, 4, 6 and 10 characters. Therefore, you can pass in any value from 3 inclusive and it’s guaranteed that result’s length will be less or equal to required length. If *max_len* is omitted, longest registered formatter will be used.

```
>>> format_time_delta(10, 3)
'10s'
>>> format_time_delta(10, 6)
'10 sec'
>>> format_time_delta(15350, 4)
'4 h'
>>> format_time_delta(15350)
'4h 15min'
```

Parameters

- **seconds** – Value to format
- **max_len** – Maximum output string length (total)

Returns

Formatted string

class pytermor.util.time_delta.TimeDeltaFormatter

Formatter for time intervals. Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”, etc.

You can create your own formatters if you need fine tuning of the output and customization. If that’s not the case, there is a facade method `format_time_delta()` which will select appropriate formatter automatically.

Example output:

"10 secs", "5 mins", "4h 15min", "5d 22h"

__init__(*units: List[TimeUnit], allow_negative: bool, unit_separator: Optional[str] = None, plural_suffix: Optional[str] = None, stylesheet: Optional[TimeDeltaStylesheet] = None, overflow_msg: str = 'OVERFLOW'*)

property stylesheet: *TimeDeltaStylesheet*

property max_len: *int*

This property cannot be set manually, it is computed on initialization automatically.

Returns

Maximum possible output string length.

format(*seconds: float, always_max_len: bool = False*) → *str*

Format the requested amount of seconds and apply styles to the result as defined in current formatter’s *stylesheet*. Default *stylesheet* contains “noop” spans only and thus no styles will be applied.

Parameters

- **seconds** – Input value.
- **always_max_len** – If result string is less than *max_len* it will be returned as is, unless this flag is set to *True*. In that case output string will be padded with spaces on the left side so that resulting length would be always equal to maximum length.

Returns

Formatted string with applied styles if they are defined, raw string otherwise.

format_raw(*seconds: float*) → *str | None*

Format the requested amount of seconds as raw string without styling.

Parameters

seconds – Input value.

Returns

Formatted string or *None* on overflow (if input value is too big for the current formatter to handle).

class pytermor.util.time_delta.TimeUnit

TimeUnit(*name: 'str', in_next: 'int' = None, custom_short: 'str' = None, collapsible_after: 'int' = None, overflow_afer: 'int' = None*)

name: *str*

in_next: *int = None*

custom_short: *str = None*

collapsible_after: *int = None*

```
overflow_afer: int = None
```

```
__init__(name: str, in_next: Optional[int] = None, custom_short: Optional[str] = None, collapsible_after: Optional[int] = None, overflow_afer: Optional[int] = None) → None
```

```
class pytermor.util.time_delta.TimeDeltaStylesheet
```

```
Bases: Stylesheet
```

```
__init__(default: Optional[Style] = None, digit: Optional[Style] = None, unit: Optional[Style] = None, overflow: Optional[Style] = None)
```

2.7.4 stdlib_ext

Some of the Python Standard Library methods rewritten for correct work with strings containing control sequences.

```
pytermor.util.stdlib_ext.ljust_sgr(s: str, width: int, fillchar: str = ' ') → str
```

SGR-formatting-aware implementation of `str.ljust`.

Return a left-justified string of length `width`. Padding is done using the specified fill character (default is a space).

```
pytermor.util.stdlib_ext.rjust_sgr(s: str, width: int, fillchar: str = ' ') → str
```

SGR-formatting-aware implementation of `str.rjust`.

Return a right-justified string of length `width`. Padding is done using the specified fill character (default is a space).

```
pytermor.util.stdlib_ext.center_sgr(s: str, width: int, fillchar: str = ' ') → str
```

SGR-formatting-aware implementation of `str.center`.

Return a centered string of length `width`. Padding is done using the specified fill character (default is a space).

2.7.5 string_filter

String filtering module.

Main idea is to provide a common interface for string filtering, that can make possible working with filters like with objects rather than with functions/lambda's.

```
pytermor.util.string_filter.apply_filters(s: AnyStr, *args: StringFilter[AnyStr] | Type[StringFilter[AnyStr]]) → AnyStr
```

Method for applying dynamic filter list to a target string/bytes. Example (will replace all ESC control characters to E and thus make SGR params visible):

```
>>> apply_filters(span.RED('test'), ReplaceSGR(r'E\2\3\5'))
'E[31mtestE[39m'
```

Note that type of `s` argument must be same as `StringFilter` parameterized type, i.e. `ReplaceNonAsciiBytes` is `StringFilter[bytes]` type, so you can apply it only to bytes-type strings.

Parameters

- **s** (*AnyStr*) – String to filter.
- **args** – *StringFilter* instance(s) or *StringFilter* class(es).

Returns

Filtered `s`.

class pytermor.util.string_filter.StringFilter

Bases: Generic

Common string modifier interface.

__init__(*pattern: AnyStr, repl: AnyStr | Callable[[AnyStr | Match], AnyStr]*)**__call__**(*s: AnyStr*) → AnyStrCan be used instead of *apply()***apply**(*s: AnyStr*) → AnyStrApply filter to *s* string (or bytes).**static** **__new__**(*cls, *args, **kws*)**class** pytermor.util.string_filter.VisualuzeWhitespaceBases: [StringFilter](#)[str]Replace every invisible character with *repl* (default is `.`), except newlines. Newlines are kept and get prepended with same string.

```
>>> VisualuzeWhitespace().apply('A B C')
'A..B..C'
>>> apply_filters('1. D\n2. L ', VisualuzeWhitespace)
'1..D.\n2..L.'
```

__init__(*repl: AnyStr = '.'*)**__call__**(*s: AnyStr*) → AnyStrCan be used instead of *apply()***static** **__new__**(*cls, *args, **kws*)**apply**(*s: AnyStr*) → AnyStrApply filter to *s* string (or bytes).**class** pytermor.util.string_filter.ReplaceSGRBases: [StringFilter](#)[str]Find all SGR seqs (e.g. `ESC[1;4m`) and replace with given string. More specific version of [ReplaceCSI](#).**Parameters****repl** – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).**__init__**(*repl: AnyStr = ''*)**__call__**(*s: AnyStr*) → AnyStrCan be used instead of *apply()***static** **__new__**(*cls, *args, **kws*)**apply**(*s: AnyStr*) → AnyStrApply filter to *s* string (or bytes).**class** pytermor.util.string_filter.ReplaceCSIBases: [StringFilter](#)[str]Find all CSI seqs (i.e. `ESC[*`) and replace with given string. Less specific version of [ReplaceSGR](#), as CSI consists of SGR and many other sequence subtypes.

Parameters

repl – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).

__init__(*repl: AnyStr* = "")

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

static __new__(*cls, *args, **kws*)

apply(*s: AnyStr*) → AnyStr

Apply filter to s string (or bytes).

class pytermor.util.string_filter.**ReplaceNonAsciiBytes**

Bases: [StringFilter](#)[bytes]

Keep 7-bit ASCII bytes [0x00 - 0x7f], replace other to ?.

Parameters

repl – Replacement byte-string.

__init__(*repl: AnyStr* = b'?')

__call__(*s: AnyStr*) → AnyStr

Can be used instead of *apply()*

static __new__(*cls, *args, **kws*)

apply(*s: AnyStr*) → AnyStr

Apply filter to s string (or bytes).

CHANGELOG

3.1 v2.0.0

- Complete library rewrite.
- High-level abstractions *Color*, *Renderer* and *Style*.
- Unit tests for formatters and new modules.
- pytest and coverage integration.
- sphinx and readthedocs integraton.

3.2 v1.8.0

- `format_prefixed_unit` extended for working with decimal and binary metric prefixes.
- `format_time_delta` extended with new settings.
- Value rounding transferred from `format_auto_float` to `format_prefixed_unit`.
- Utility classes reorganization.
- Unit tests output formatting.
- `sequence.NOOP` SGR sequence and `span.NOOP` format.
- Max decimal points for `auto_float` extended from (2) to (max-2).

3.3 v1.7.4

- Added 3 formatters: `format_prefixed_unit`, `format_time_delta`, `format_auto_float`.

3.4 v1.7.3

- Added `span.BG_BLACK` format.

3.5 v1.7.2

- Added `ljust_sgr`, `rjust_sgr`, `center_sgr` util functions to align strings with SGRs correctly.

3.6 v1.7.1

- Print reset sequence as `\e[m` instead of `\e[0m`.

3.7 v1.7.0

- `Span` constructor can be called without arguments.
- Added SGR code lists.

3.8 v1.6.2

- Excluded `tests` dir from distribution package.

3.9 v1.6.1

- Ridded of `EmptyFormat` and `AbstractFormat` classes.
- Renamed code module to `sgr` because of conflicts in PyCharm debugger (`pydevd_console_integration.py`).

3.10 v1.5.0

- Removed excessive `EmptySequenceSGR` – default SGR class was specifically implemented to print out as empty string instead of `\e[m` if constructed without params.

3.11 v1.4.0

- `Span.wrap()` now accepts any type of argument, not only `str`.
- Rebuilt Sequence inheritance tree.
- Added equality methods for `SequenceSGR` and `Span` classes/subclasses.
- Added some tests for `fmt.*` and `seq.*` classes.

3.12 v1.3.2

- Added `span.GRAY` and `span.BG_GRAY` format presets.

3.13 v1.3.1

- Interface revisioning.

3.14 v1.2.1

- `opening_seq` and `closing_seq` properties for `Span` class.

3.15 v1.2.0

- `EmptySequenceSGR` and `EmptyFormat` classes.

3.16 v1.1.0

- Autoformat feature.

3.17 v1.0.0

- First public version.
