	Index	115

(yet another) Python library initially designed for formatting terminal output using ANSI escape codes.

Provides *high-level* methods for working with text sections, colors, formats, alignment and wrapping, as well as *low-level* *ansi* module which allows operating with SGR (Select Graphic Rendition) *sequences* and also implements automatic “soft” format termination. Depending on the context and technical requirements either approach can be used. Also includes a set of additional number/string/date formatters for pretty output.

Key feature of this library is extendability and a variety of formatters (called *renderers*), which determine the output syntax:

- *SgrRenderer* (global default)
- *TmuxRenderer*
- *HtmlRenderer*
- *SgrDebugger* (mostly for development)
- etc.

No dependencies required, only Python Standard Library (there are some for testing and docs building, though).

Todo: This is how you **should** format examples:

We put these pieces together to create a SGR command. Thus, `ESC[3m` specifies bold (or bright) text, and `ESC[31m` specifies red foreground text. We can chain together parameters; for example, `ESC[32;47m` specifies green foreground text on a white background.

The following diagram shows a complete example for rendering the word “text” in red with a single underline.

Notes

- For terminals that support bright foreground colors, `ESC[1;3Xm` is usually equivalent to `ESC[9Xm` (where `X` is a digit in 0-7). However, the reverse does not seem to hold, at least anecdotally: `ESC[2;9Xm` usually does not render the same as `ESC[3Xm`.
- Not all terminals support every effect.

Fig. 1: <https://chrisyeh96.github.io/2020/03/28/terminal-colors.html#color-schemes>

1

GUIDE

1.1 Getting started

1.1.1 Installation

Python 3.8 or later should be installed and available in `$PATH`; that's basically it if intended usage of the package is as a library.

Listing 1: Installing into a project

```
$ python -m pip install pytermor
```

Listing 2: Standalone installation (for developing or experimenting)

```
$ git clone git@github.com:delameter/pytermor.git .
$ python -m venv venv
$ PYTHONPATH=. venv/bin/python -m pytermor
v2.41.1-dev1:Feb-23
```

1.1.2 Library structure

A L	Module	Class(es)	Purpose
Hi	<code>text</code>	<code>Text</code>	Container consisting of text pieces each with attached <code>Style</code> . Renders into specified format keeping all the formatting.
		<code>Style</code> <code>Styles</code>	Reusable abstractions defining colors and text attributes (text color, bg color, <i>bold</i> attribute, <i>underlined</i> attribute etc).
		<code>SgrRenderer</code> <code>HtmlRenderer</code> <code>TmuxRenderer</code> etc.	<code>SgrRenderer</code> transforms <code>Style</code> instances into <code>Color</code> , <code>Span</code> and <code>SequenceSGR</code> instances and assembles it all up. There are several other implementations depending on what output format is required.
	<code>color</code>	<code>Color16</code> <code>Color256</code> <code>ColorRGB</code>	Abstractions for color operations in different color modes (default 16-color, 256-color, RGB). Tools for color approximation and transformations.
		<code>pytermor</code>	Color registry.
Lo	<code>ansi</code>	<code>Span</code>	Abstraction consisting of “opening” SGR sequence defined by the developer (or taken from preset list) and complementary “closing” SGR sequence that is built automatically.
		<code>Spans</code>	Registry of predefined instances in case the developer doesn’t need dynamic output formatting and just wants to colorize an error message.
		<code>SequenceSGR</code> <code>SeqIndex</code>	Abstractions for manipulating ANSI control sequences and classes-factories, plus a registry of preset SGRs.
		<code>IntCodes</code>	Registry of escape control sequence parameters.
	<code>util</code>	<code>*</code>	Additional formatters and common methods for manipulating strings with SGRs inside.

1.1.3 Features

One of the core concepts of the library is `Span` class. `Span` is a combination of two control sequences; it wraps specified string with pre-defined leading and trailing SGR definitions.

Example code:

```
1 from pytermor import Spans
2
3 print(Spans.RED('Feat') + Spans.BOLD('ures'))
```

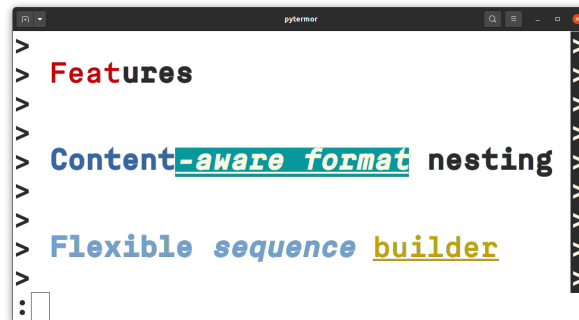

Content-aware format nesting

Compose text spans with automatic content-aware span termination. Preset spans can safely overlap with each other (as long as they require different *breaker* sequences to reset).

```

1 from pytermor import Span
2
3 span1 = Span('blue', 'bold')
4 span2 = Span('cyan', 'inversed', 'underlined', 'italic')
5
6 msg = span1(f'Content{span2("-aware format")} nesting')
7 print(msg)

```

Flexible sequence builder

Create your own *SGR sequences* using default constructor, which accepts color/attribute keys, integer codes and even existing *SGRs*, in any amount and in any order. Key resolving is case-insensitive.

```

1 from pytermor import SeqIndex, SequenceSGR
2
3 seq1 = SequenceSGR('hi_blue', 1) # keys or integer codes
4 seq2 = SequenceSGR(seq1, SeqIndex.ITALIC) # existing SGRs
5 seq3 = SequenceSGR('underlined', 'YELLOW') # case-insensitive
6
7 msg = f'{seq1}Flexible{SeqIndex.RESET} ' + \
8       f'{seq2}sequence{SeqIndex.RESET} ' + \
9       str(seq3) + 'builder' + str(SeqIndex.RESET)
10 print(msg)

```

256 colors / True Color support

The library supports extended color modes:

- XTerm 256 colors indexed mode (see *ANSI preset list*);
- True Color RGB mode (16M colors).

```

1 from pytermor import SequenceSGR, SeqIndex
2
3 start_color = 41
4 boxchr = "\u2588"
5 for idx, c in enumerate(range(start_color, start_color+(36*6), 36)):
6     print(f'{SequenceSGR.new_color_256(c)}{boxchr*3}{SeqIndex.COLOR_OFF}', end='')
7
8 print('\n')

```

(continues on next page)

(continued from previous page)

```

9 for idx, c in enumerate(range(0, 256, 256//17)):
10     r = max(0, 255-c)
11     g = max(0, min(255, 127-(c*2)))
12     b = c
13     print(f'{SequenceSGR.new_color_rgb(r, g, b)}{boxchr}{SeqIndex.COLOR_OFF}', end='')

```

Customizable output formats

Todo: @TODOTODO

String and number formatters

Todo: @TODOTODO

1.1.4 CLI usage

Commands like the ones below can be used for quick experimenting without loading the IDE:

- One-liner for system-wide installation (which is not recommended):

```
$ python -c "import pytermor as pt; pt.echo('RED', 'red')"
```

- One-liner for virtual environment (venv) with *pytermor* pre-installed (see *Installation*) (note that the library source code root folder should be used as current working directory):

```
$ PYTHONPATH=. venv/bin/python -c "import pytermor as pt; pt.echo('GREEN', 'green
↪')"
```

- Interactive mode for virtual environment with *pytermor* pre-installed (again, current working directory should be sources root dir):

```
$ PYTHONSTARTUP=.run-startup.py PYTHONPATH=. venv/bin/python -qi
```

```
python 3.8.10
pytermor 2.41.1-dev1
>>> pt.echo("This is warning, be warned", pt.Styles.WARNING)
```

1.2 High-level core API

Glossary

rendering

A process of transforming text-describing instances into specified output format, e.g. instance of *Fragment* class with content and *Style* class containing colors and other text formatting can be rendered into terminal-compatible string with *SgrRenderer*, or into HTML markup with *HtmlRenderer*, etc.

style

Class describing text format options: text color, background color, boldness, underlining, etc. Styles can be inherited and merged with each other. See *Style* constructor description for the details.

color

Three different classes describing the color options: *Color16*, *Color256* and *ColorRGB*. The first one corresponds to 16-color terminal mode, the second – to 256-color mode, and the last one represents full RGB color space rather than color index palette. The first two also contain terminal *SGR* bindings.

1.2.1 Core methods

text.render([string, fmt, renderer, ...])

.

text.echo([string, fmt, renderer, ...])

.

<i>color.resolve_color</i> (subject[, color_type])	Case-insensitive search through registry contents.
--	--

<i>style.make_style</i> ([fmt])	General <i>Style</i> constructor.
---------------------------------	-----------------------------------

<i>style.merge_styles</i> ([base, fallbacks, overwrites])	Bulk style merging method.
---	----------------------------

1.2.2 Colors

1.2.3 Styles

1.2.4 Output format control

1.5 Number formatters

Todo: The library contains @TODO

1.5.1 Auto-float formatter

1.5.2 Prefixed-unit formatter

1.5.3 Time delta formatter

```

1 import pytermor.utilnum
2 from pytermor import RendererManager, SgrRenderer
3 from pytermor.util import time_delta
4
5 seconds_list = [2, 10, 60, 2700, 32340, 273600, 4752000, 864000000]
6 max_len_list = [3, 6, 10]

```

(continues on next page)

(continued from previous page)

```

7
8 for max_len in max_len_list:
9     formatter = pytermor.utilnum.dual_registry.find_matching(max_len)
10
11 RendererManager.set_default(SgrRenderer)
12 for seconds in seconds_list:
13     for max_len in max_len_list:
14         formatter = pytermor.utilnum.dual_registry.get_by_max_len(max_len)
15         print(formatter.format(seconds), end=' ')
16     print()

```

1.6 ColorRGB collection

Todo: @TODO

1.7 Low-level core API

So, what's happening under the hood?

1.7.1 Glossary

ANSI escape sequence

is a standard for in-band signaling to control cursor location, color, font styling, and other options on video text terminals and terminal emulators. Certain sequences of bytes, most starting with an ASCII escape character and a bracket character, are embedded into text. The terminal interprets these sequences as commands, rather than text to display verbatim.¹

SGR

ANSI escape sequence with varying amount of parameters. SGR sequences allow to change the color of text or/and terminal background (in 3 different color spaces) as well as decorate text with italic style, underlining, overlining, cross-lining, making it bold or blinking etc. Represented by *SequenceSGR* class.

1.7.2 Core methods

<code>ansi.SequenceSGR(*args)</code>	Class representing SGR-type escape sequence with varying amount of parameters.
<code>ansi.make_color_256(code[, bg])</code>	Wrapper for creation of <i>SequenceSGR</i> that sets foreground (or background) to one of 256-color palette value.:
<code>ansi.make_color_rgb(r, g, b[, bg])</code>	Wrapper for creation of <i>SequenceSGR</i> operating in True Color mode (16M). Valid values for <i>r</i> , <i>g</i> and <i>b</i> are in range of [0; 255]. This range linearly translates into [0x00; 0xFF] for each channel. The result value is composed as "0xRRGGBB". For example, sequence with color of 0xFF3300 can be created with::

1.7.3 Format soft reset

There are two ways to manage color and attribute termination:

- hard reset (SGR-0 or ESC [0m)
- soft reset (SGR-22, 23, 24 etc.)

The main difference between them is that *hard* reset disables all formatting after itself, while *soft* reset disables only actually necessary attributes (i.e. used as opening sequence in *Span* instance's context) and keeps the other.

That's what *Span* class is designed for: to simplify creation of soft-resetting text spans, so that developer doesn't have to restore all previously applied formats after every closing sequence.

¹ https://en.wikipedia.org/wiki/ANSI_escape_code

Example

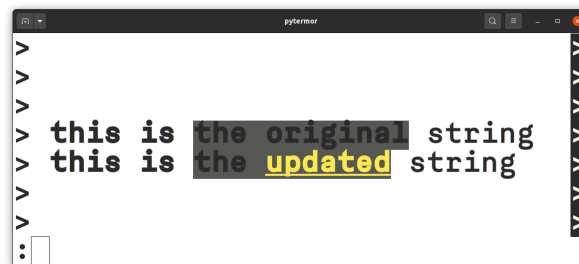

We are given a text span which is initially *bold* and *underlined*. We want to recolor a few words inside of this span. By default this will result in losing all the formatting to the right of updated text span (because [RESET](#), or ESC [0m, clears all text attributes).

However, there is an option to specify what attributes should be disabled or let the library do that for you:

```

1 from pytermor import Span, Spans, SeqIndex
2
3 # implicitly:
4 span_warn = Span(93, 4)
5 # or explicitly:
6 span_warn = Span.init_explicit(
7     SeqIndex.HI_YELLOW + SeqIndex.UNDERLINED, # sequences can be summed up, remember?
8     SeqIndex.COLOR_OFF + SeqIndex.UNDERLINED_OFF, # "counteractive" sequences
9     hard_reset_after=False
10 )
11
12 orig_text = Spans.BOLD(f'this is {SeqIndex.BG_GRAY}the original{SeqIndex.RESET} string
13 ↪')
14 updated_text = orig_text.replace('original', span_warn('updated'), 1)
15 print(orig_text, '\n', updated_text)

```

As you can see, the update went well – we kept all the previously applied formatting. Of course, this method cannot be 100% applicable; for example, imagine that original text was colored blue. After the update “string” word won’t be blue anymore, as we used `SeqIndex.COLOR_OFF` escape sequence to neutralize our own yellow color. But it still can be helpful for a majority of cases (especially when text is generated and formatted by the same program and in one go).

1.7.4 Working with Spans

Use `Span` constructor to create new instance with specified control sequence(s) as a opening/starter sequence and **automatically composed** closing sequence that will terminate attributes defined in opening sequence while keeping the others (soft reset).

Resulting sequence params’ order is the same as argument’s order.

Each sequence param can be specified as:

- string key (see [ANSI preset list](#));
- integer param value;
- existing [SequenceSGR](#) instance (params will be extracted).

It’s also possible to avoid auto-composing mechanism and create `Span` with explicitly set parameters using `Span.init_explicit()`.

1.7.5 Creating and applying SGRs

You can use any of predefined sequences from [SeqIndex](#) registry or create your own via standard constructor. Valid argument values as well as preset constants are described in [ANSI preset list](#) page.

Important: SequenceSGR with zero params was specifically implemented to translate into an empty string and not into ESC [m, which would make sense, but also could be very entangling, as terminal emulators interpret that sequence as ESC [0m, which is *hard* reset sequence.

There is also a set of methods for dynamic SequenceSGR creation:

- `make_color_256()` will produce sequence operating in 256-colors mode (for a complete list see [ANSI preset list](#));
- `make_color_rgb()` will create a sequence capable of setting the colors in True Color 16M mode (however, some terminal emulators doesn't support it).

To get the resulting sequence chars use `assemble()` method or cast instance to `str`.

```

1 from pytermor import SequenceSGR
2
3 seq = SequenceSGR(4, 7)
4 msg = f'({seq})'
5
6 print(msg + f'{SequenceSGR(0).assemble()}')
7 print(str(msg.assemble()))
8 print(msg.assemble().hex(':'))

```

- First line is the string with encoded escape sequence;
- Second line shows up the string in raw mode, as if sequences were ignored by the terminal;
- Third line is hexadecimal string representation.

1.7.6 SGR sequence structure

1. ESC is escape *control character*, which opens a control sequence (can also be written as `\x1b`, `\033` or `\e`).
2. `[` is sequence *introducer*; it determines the type of control sequence (in this case it's CSI (Control Sequence Introducer)).
3. 4 and 7 are *parameters* of the escape sequence; they mean “underlined” and “inversed” attributes respectively. Those parameters must be separated by `;`.
4. `m` is sequence *terminator*; it also determines the sub-type of sequence, in our case SGR. Sequences of this kind are most commonly encountered.

1.7.7 Combining SGRs

One instance of *SequenceSGR* can be added to another. This will result in a new *SequenceSGR* with combined params.

```

1 from pytermor import SequenceSGR, SeqIndex
2
3 combined = SequenceSGR(1, 31) + SequenceSGR(4)
4 print(f'{combined}{combined}{SeqIndex.RESET}', str(combined).assemble())

```

1.7.8 Class hierarchy

Fig. 7: *ISequence* inheritance tree

Sources

2. XTerm Control Sequences⁵
3. ECMA-48 specification⁶

1.8 ANSI preset list

Preset lists are omitted from API docs to avoid unnecessary duplication; summary list of all presets defined in the library (excluding *util**) is displayed here.

Todo: USAGE - list all memthods that accept string keys of those prsets.

There are two types of color palettes used in modern terminals – first one containing 16 colors (*Color16*), and second one consisting of 256 colors (*Color256*). There is also True Color mode (referenced as *RGB* mode), but it is not palette-based.

⁶ <https://www.ecma-international.org/publications-and-standards/standards/ecma-48/>

Legend

- INT (intcode module -- 1st or 3rd SGR param value)
- STY (style module)

1.8.1 Meta, attributes, resetters

	Name	INT	STY	Description
Meta				
	NOOP		V	No-operation; always assembled as empty string
	RESET	0		Reset all attributes and colors
Attributes				
	BOLD	1	V¹	Bold or increased intensity
	DIM	2	V	Faint, decreased intensity
	ITALIC	3	V	Italic; <i>not widely supported</i>
	UNDERLINED	4	V	Underline
	BLINK_SLOW	5	V²	Set blinking to < 150 cpm
	BLINK_FAST	6		Set blinking to 150+ cpm; <i>not widely supported</i>
	INVERSED	7	V	Swap foreground and background colors
	HIDDEN	8		Conceal characters; <i>not widely supported</i>
	CROSSLINED	9	V	Strikethrough
	DOUBLE_UNDERLINED	21		Double-underline; <i>on several terminals disables BOLD instead</i>
	COLOR_EXTENDED	38		Set foreground color [<i>indexed/RGB</i> mode]; use <i>make_color_256</i> and <i>make_color_rgb</i> instead
	BG_COLOR_EXTENDED	48		Set background color [<i>indexed/RGB</i> mode]; use <i>make_color_256</i> and <i>make_color_rgb</i> instead
	OVERLINED	53	V	Overline; <i>not widely supported</i>
Resetters				
	BOLD_DIM_OFF	22		Disable BOLD and DIM attributes. <i>Special aspects... It's impossible to reliably disable them on a separate basis.</i>
	ITALIC_OFF	23		Disable italic
	UNDERLINED_OFF	24		Disable underlining
	BLINK_OFF	25		Disable blinking
	INVERSED_OFF	27		Disable inversing
	HIDDEN_OFF	28		Disable concealing
	CROSSLINED_OFF	29		Disable strikethrough
	COLOR_OFF	39		Reset foreground color
	BG_COLOR_OFF	49		Reset background color
	OVERLINED_OFF	55		Disable overlining

¹ for this and subsequent items in “Attributes” section: as boolean flags.

² as blink.

1.8.2 Color16 presets

	Name	INT	STY	RGB code	XTerm name
Foreground default colors					
	BLACK	30		#000000	Black
	RED	31		#800000	Maroon
	GREEN	32		#008000	Green
	YELLOW	33		#808000	Olive
	BLUE	34		#000080	Navy
	MAGENTA	35		#800080	Purple
	CYAN	36		#008080	Teal
	WHITE	37		#c0c0c0	Silver
Background default colors					
	BG_BLACK	40		#000000	Black
	BG_RED	41		#800000	Maroon
	BG_GREEN	42		#008000	Green
	BG_YELLOW	43		#808000	Olive
	BG_BLUE	44		#000080	Navy
	BG_MAGENTA	45		#800080	Purple
	BG_CYAN	46		#008080	Teal
	BG_WHITE	47		#c0c0c0	Silver
High-intensity foreground default colors					
	GRAY	90		#808080	Grey
	HI_RED	91		#ff0000	Red
	HI_GREEN	92		#00ff00	Lime
	HI_YELLOW	93		#ffff00	Yellow
	HI_BLUE	94		#0000ff	Blue
	HI_MAGENTA	95		#ff00ff	Fuchsia
	HI_CYAN	96		#00ffff	Aqua
	HI_WHITE	97		#ffffff	White
High-intensity background default colors					
	BG_GRAY	100		#808080	Grey
	BG_HI_RED	101		#ff0000	Red
	BG_HI_GREEN	102		#00ff00	Lime
	BG_HI_YELLOW	103		#ffff00	Yellow
	BG_HI_BLUE	104		#0000ff	Blue
	BG_HI_MAGENTA	105		#ff00ff	Fuchsia
	BG_HI_CYAN	106		#00ffff	Aqua
	BG_HI_WHITE	107		#ffffff	White

1.8.3 Color256 presets

	Name	INT	STY	RGB code	XTerm name
	XTERM_BLACK ³	0		#000000

³ First 16 colors are effectively the same as colors in *default* 16-color mode and share with them the same color values (and depend on terminal color scheme as well).

⁴ XTerm name list contains duplicates; variable names for these were slightly modified (different numbers at the end) to avoid namespace conflicts. Every changed name is displayed with **bold** font.

1.9 Color spaces

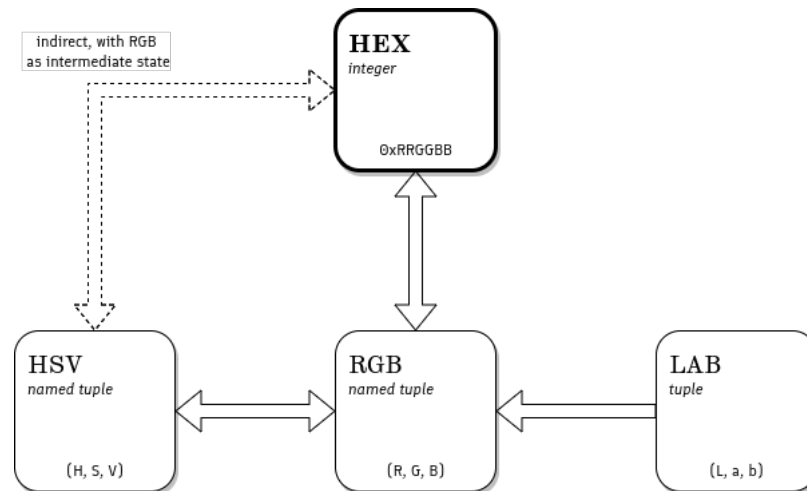

Fig. 8: Supported color spaces and transformations

1.10 Color256 palette

Actual colors of *default* palette depend on user's terminal settings, i.e. the result color of *Color16* is not guaranteed to exactly match the corresponding color listed below. What's more, note that *default* palette is actually a part of *indexed* one (first 16 colors of 256-color table).

Todo: (Verify) The approximation algorithm was explicitly made to ignore these colors because otherwise the results of transforming *RGB* values into *indexed* ones would be unpredictable, in addition to different results for different users, depending on their terminal emulator setup.

However, it doesn't mean that *Color16* is useless. Just the opposite – it's ideal for situations when you don't actually **have to** set exact values and it's easier to specify estimation of desired color. I.e. setting color to 'red' is usually more than enough for displaying an error message – we don't really care of precise hue or brightness values for it.

Todo: Approximation algorithm is as simple as iterating through all colors in the *lookup table* (which contains all possible ...

1.12 Docs guidelines

(mostly as a reminder for myself)

1.12.1 General

- Basic types and built-in values should be surrounded with asterisks:

`*True*` → *True*

`*None*` → *None*

`*int*` → *int*

- Library classes, methods, etc. should be enclosed in single backticks in order to become a hyperlinks:

``SgrRenderer.render()`` → *[SgrRenderer.render\(\)](#)*

- Argument names and string literals that include escape sequences or their fragments should be wrapped in double backticks:

```arg1``` → *arg1*

```ESC [31m ESC [m``` → *ESC [31m ESC [m*

On the top of that, ESC control char should be padded with spaces for better readability. This also triggers automatic application of custom style for even more visual difference.

- Any formula should be formatted using LaTeX syntax (`:math:` role or `.. math::` directive):

$$d_{min} = 350 * 10^{-3}$$

API REFERENCE

Note: Almost all public classes are imported into the first package level on its initialization, i.e., “short” forms like `from pytermor import ColorRGB` are supported, not only “full forms” as `from pytermor.color import ColorRGB`.

`pytermor.cv = <pytermor.cval.CVAL object>`

Shortcut to [CVAL\(\)](#) color registry.

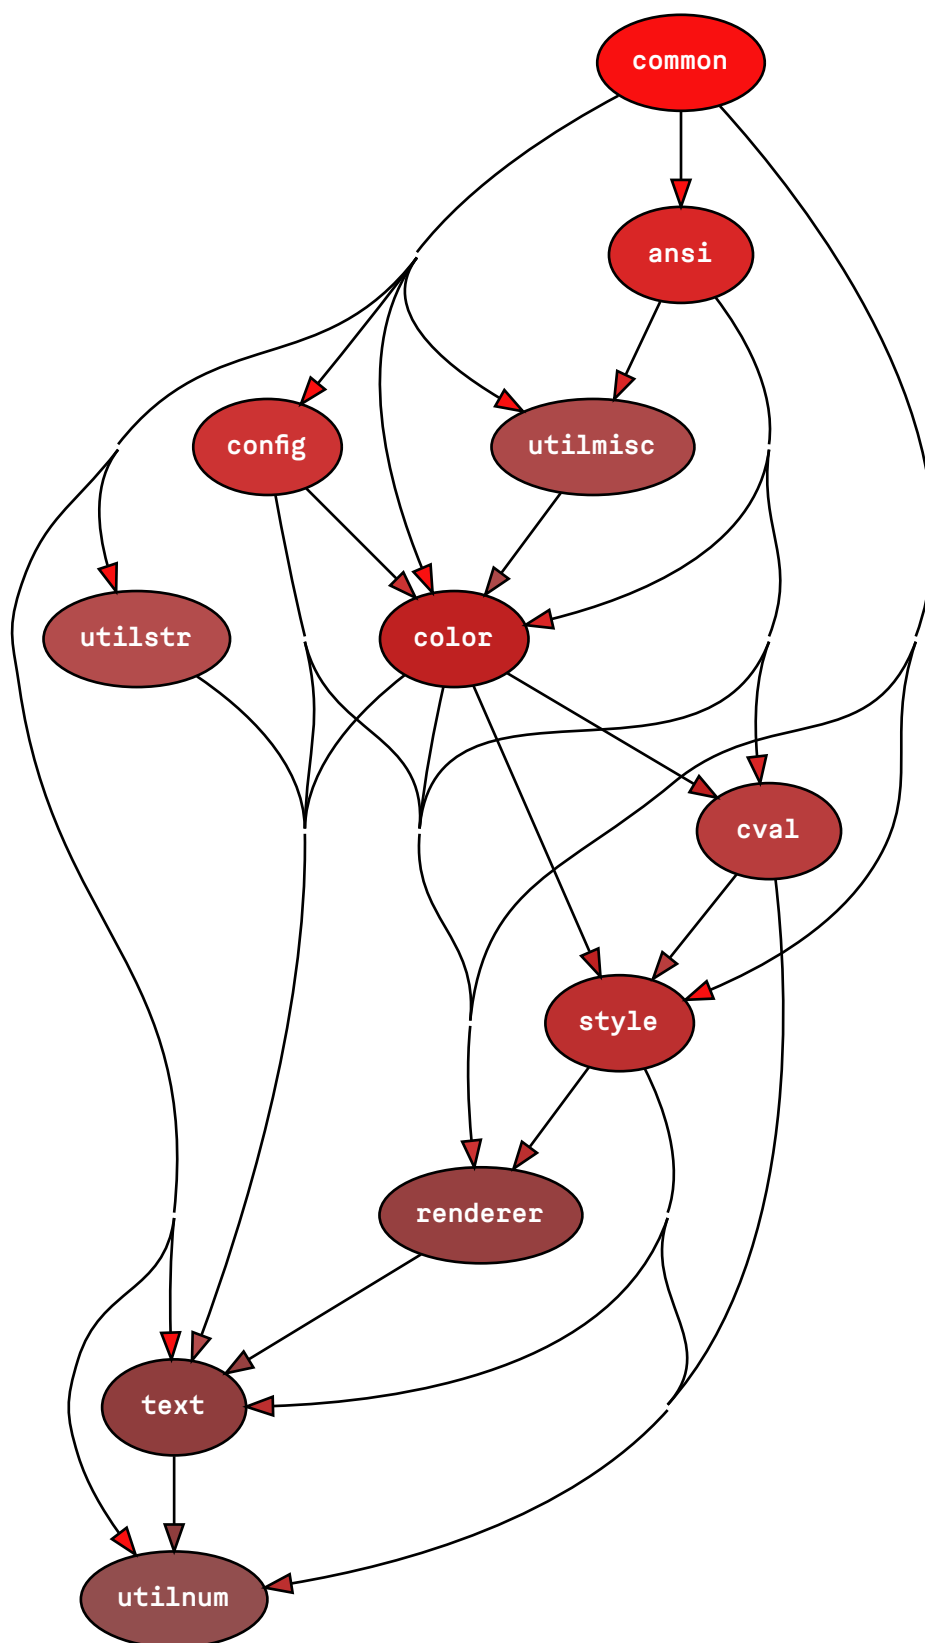

Fig. 1: Module dependency graph

<i>ansi</i>	Classes for working with ANSI sequences on lower level.
<i>color</i>	Color main classes and helper functions.
<i>common</i>	Shared code suitable for the package as well as any other.
<i>config</i>	Library fine tuning.
<i>cval</i>	Color preset list:
<i>renderer</i>	Output formatters.
<i>style</i>	
<i>text</i>	"Front-end" module of the library.
<i>utilmisc</i>	A
<i>utilnum</i>	utilnum
<i>utilstr</i>	Formatters for prettier output and utility classes to avoid writing boilerplate code when dealing with escape sequences.

2.1 pytermor.ansi

Classes for working with ANSI sequences on lower level. Can be used for creating a variety of sequences including:

- SGR sequences (text and background coloring, other text formatting and effects);
- CSI sequences (cursor management, selective screen clearing);
- OSC (Operating System Command) sequences (various system commands).

Important: blah-blah-blah low-level @TODO

Module Attributes

<i>NOOP_SEQ</i>	Special sequence in case you <i>have to</i> provide one or another SGR, but do not want any control sequences to be actually included in the output.
-----------------	--

Functions

<code>assemble_hyperlink(url[, label])</code>	param url
<code>decompose_request_cursor_position(string)</code>	Parse RCP (Report Cursor Position) sequence that generally comes from a terminal as a response to <i>QCP</i> sequence and contains a cursor's current row and column.
<code>enclose(opening_seq, string)</code>	param opening_seq
<code>get_closing_seq(opening_seq)</code>	param opening_seq
<code>make_color_256(code[, bg])</code>	Wrapper for creation of <i>SequenceSGR</i> that sets foreground (or background) to one of 256-color palette value.:
<code>make_color_rgb(r, g, b[, bg])</code>	Wrapper for creation of <i>SequenceSGR</i> operating in True Color mode (16M). Valid values for <i>r</i> , <i>g</i> and <i>b</i> are in range of [0; 255]. This range linearly translates into [0x00; 0xFF] for each channel. The result value is composed as "0xRRGGBB". For example, sequence with color of 0xFF3300 can be created with::
<code>make_erase_in_line([mode])</code>	Create EL (Erase in Line) sequence that erases a part of the line or the entire line.
<code>make_hyperlink_part([url])</code>	param url
<code>make_query_cursor_position()</code>	Create QCP (Query Cursor Position) sequence that requests an output device to respond with a structure containing current cursor coordinates (<i>RCP</i>).
<code>make_set_cursor_x_abs([x])</code>	Create CHA (Cursor Horizontal Absolute) sequence that sets cursor horizontal position, or column, to <i>x</i> .

Classes

<code>ISequence(*params)</code>	Abstract ancestor of all escape sequences.
<code>ISequenceFe(*params)</code>	Wide range of sequence types that includes <i>CSI</i> , <i>OSC</i> and more.
<code>IntCode(value)</code>	Complete or almost complete list of reliably working SGR param integer codes.
<code>SeqIndex()</code>	Registry of static sequence presets.
<code>SequenceCSI(terminator, short_name, *params)</code>	Class representing CSI-type ANSI escape sequence.
<code>SequenceOSC(*params)</code>	OSC-type sequence.
<code>SequenceSGR(*args)</code>	Class representing SGR-type escape sequence with varying amount of parameters.
<code>SequenceST(*params)</code>	String Terminator sequence (ST).

class `pytermor.ansi.ISequence(*params)`

Bases: Sized

Abstract ancestor of all escape sequences.

Parameters

params (*int* / *str*) – Sequence internal parameters; amount varies depending on sequence type.

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

`str`

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.ISequenceFe(*params)`

Bases: `ISequence`

Wide range of sequence types that includes `CSI`, `OSC` and more.

All subtypes of this sequence start with ESC plus ASCII byte from 0x40 to 0x5F (@, [, \,], _, ^ and capital letters A-Z).

Parameters

params (*int* / *str*) – Sequence internal parameters; amount varies depending on sequence type.

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

`str`

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceST(*params)`

Bases: `ISequenceFe`

String Terminator sequence (ST). Terminates strings in other control sequences. Encoded as ESC \ (0x1B 0x5C).

Parameters

params (*int* / *str*) – Sequence internal parameters; amount varies depending on sequence type.

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

`str`

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceOSC(*params)`

Bases: `ISequenceFe`

OSC-type sequence. Starts a control string for the operating system to use. Encoded as ESC], plus params separated by ;, and terminated with `SequenceST`.

Parameters

params (*int* / *str*) – Sequence internal parameters; amount varies depending on sequence type.

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

str

property params: List[int | str]

Return internal params as array.

class pytermor.ansi.SequenceCSI(*terminator, short_name, *params*)Bases: [ISequenceFe](#)

Class representing CSI-type ANSI escape sequence. All subtypes of this sequence start with ESC [.

Sequences of this type are used to control text formatting, change cursor position, erase screen and more.

```
>>> make_erase_in_line().assemble()
'[\0K'
```

Parameters

- **terminator** (*str*) –
- **short_name** (*str*) –
- **params** (*int*) –

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

str

property params: List[int | str]

Return internal params as array.

class pytermor.ansi.SequenceSGR(**args*)Bases: [SequenceCSI](#)

Class representing SGR-type escape sequence with varying amount of parameters. SGR sequences allow to change the color of text or/and terminal background (in 3 different color spaces) as well as set decorate text with italic style, underlining, overlining, cross-lining, making it bold or blinking etc.

```
>>> SequenceSGR(IntCode.HI_CYAN, 'underlined', 1)
<SGR[96,4,1]>
```

To encode into control sequence byte-string invoke [assemble\(\)](#) method or cast the instance to *str*, which internally does the same (this actually applies to all children of [ISequence](#)):

```
>>> SequenceSGR('blue', 'italic').assemble()
'[\34;3m'
>>> str(SequenceSGR('blue', 'italic'))
'[\34;3m'
```

The latter also allows fluent usage in f-strings:

```
>>> f'{SeqIndex.RED}should be red{SeqIndex.RESET}'
'[\31mshould be red[\0m'
```

Note: [SequenceSGR](#) with zero params was specifically implemented to translate into empty string and not into ESC [m, which would have made sense, but also would be entangling, as this sequence is the equivalent of ESC [\0m – hard reset sequence. The empty-string-sequence is predefined at module level as [NOOP_SEQ](#).

Note: The module doesn't distinguish "single-instruction" sequences from several ones merged together, e.g. `Style(fg='red', bold=True)` produces only one opening `SequenceSGR` instance:

```
>>> SequenceSGR(IntCode.BOLD, IntCode.RED).assemble()
'[1;31m'
```

...although generally speaking it is two of them (`ESC [1m` and `ESC [31m`). However, the module can automatically match terminating sequences for any form of input SGRs and translate it to specified format.

It is possible to add of one SGR sequence to another, resulting in a new one with merged params:

```
>>> SequenceSGR('blue') + SequenceSGR('italic')
<SGR[34,3]>
```

Parameters

- **args** (*str* / *int* / `SequenceSGR`) – Sequence params. Resulting param order is the same as an argument order. Each argument can be specified as:
 - *str* – any of `IntCode` names, case-insensitive;
 - *int* – `IntCode` instance or plain integer;
 - another `SequenceSGR` instance (params will be extracted).
- **terminator** –
- **short_name** –
- **params** –

assemble()

Build up actual byte sequence and return as an ASCII-encoded string.

Return type

`str`

property params: `List[int]`

Returns

Sequence params as integers or `IntCode` instances.

`pytermor.ansi.NOOP_SEQ = <SGR[NOP]>`

Special sequence in case you *have to* provide one or another SGR, but do not want any control sequences to be actually included in the output.

`NOOP_SEQ.assemble()` returns empty string, `NOOP_SEQ.params` returns empty list:

```
>>> NOOP_SEQ.assemble()
''
>>> NOOP_SEQ.params
[]
```

Can be safely added to regular `SequenceSGR` from any side, as internally `SequenceSGR` always makes a new instance with concatenated params from both items, rather than modifies state of either of them:

```
>>> NOOP_SEQ + SequenceSGR(1)
<SGR[1]>
>>> SequenceSGR(3) + NOOP_SEQ
<SGR[3]>
```

```
class pytermor.ansi.IntCode(value)
```

Bases: IntEnum

Complete or almost complete list of reliably working SGR param integer codes. Fully interchangeable with plain *int*. Suitable for *SequenceSGR* default constructor.

Note: *IntCode* predefined constants are omitted from documentation to avoid useless repeats and save space, as most of the time “higher-level” class *SeqIndex* is more appropriate, and on top of that, the constant names are literally the same for *SeqIndex* and *IntCode*.

```
classmethod resolve(name)
```

Parameters

name (*str*) –

Return type

IntCode

```
class pytermor.ansi.SeqIndex
```

Registry of static sequence presets.

RESET = <SGR[0]>

Hard reset sequence.

BOLD = <SGR[1]>

Bold or increased intensity.

DIM = <SGR[2]>

Faint, decreased intensity.

ITALIC = <SGR[3]>

Italic (*not widely supported*).

UNDERLINED = <SGR[4]>

Underline.

BLINK_SLOW = <SGR[5]>

Set blinking to < 150 cpm.

BLINK_FAST = <SGR[6]>

Set blinking to 150+ cpm (*not widely supported*).

INVERSED = <SGR[7]>

Swap foreground and background colors.

HIDDEN = <SGR[8]>

Conceal characters (*not widely supported*).

CROSSLINED = <SGR[9]>

Strikethrough.

DOUBLE_UNDERLINED = <SGR[21]>

Double-underline. *On several terminals disables **BOLD** instead.*

OVERLINED = <SGR[53]>

Overline (*not widely supported*).

BOLD_DIM_OFF = <SGR[22]>

Disable **BOLD** and **DIM** attributes.

Special aspects... It's impossible to reliably disable them on a separate basis.

ITALIC_OFF = <SGR[23]>

Disable italic.

UNDERLINED_OFF = <SGR[24]>

Disable underlining.

BLINK_OFF = <SGR[25]>

Disable blinking.

INVERSED_OFF = <SGR[27]>

Disable inversing.

HIDDEN_OFF = <SGR[28]>

Disable conecaling.

CROSSLINED_OFF = <SGR[29]>

Disable strikethrough.

OVERLINED_OFF = <SGR[55]>

Disable overlining.

BLACK = <SGR[30]>

Set text color to 0x000000.

RED = <SGR[31]>

Set text color to 0x800000.

GREEN = <SGR[32]>

Set text color to 0x008000.

YELLOW = <SGR[33]>

Set text color to 0x808000.

BLUE = <SGR[34]>

Set text color to 0x000080.

MAGENTA = <SGR[35]>

Set text color to 0x800080.

CYAN = <SGR[36]>

Set text color to 0x008080.

WHITE = <SGR[37]>

Set text color to 0xC0C0C0.

COLOR_OFF = <SGR[39]>

Reset foreground color.

BG_BLACK = <SGR[40]>

Set background color to 0x000000.

BG_RED = <SGR[41]>

Set background color to 0x800000.

BG_GREEN = <SGR[42]>

Set background color to 0x008000.

BG_YELLOW = <SGR[43]>

Set background color to 0x808000.

BG_BLUE = <SGR[44]>

Set background color to 0x000080.

BG_MAGENTA = <SGR[45]>
 Set background color to 0x800080.

BG_CYAN = <SGR[46]>
 Set background color to 0x008080.

BG_WHITE = <SGR[47]>
 Set background color to 0xC0C0C0.

BG_COLOR_OFF = <SGR[49]>
 Reset background color.

GRAY = <SGR[90]>
 Set text color to 0x808080.

HI_RED = <SGR[91]>
 Set text color to 0xFF0000.

HI_GREEN = <SGR[92]>
 Set text color to 0x00FF00.

HI_YELLOW = <SGR[93]>
 Set text color to 0xFFFF00.

HI_BLUE = <SGR[94]>
 Set text color to 0x0000FF.

HI_MAGENTA = <SGR[95]>
 Set text color to 0xFF00FF.

HI_CYAN = <SGR[96]>
 Set text color to 0x00FFFF.

HI_WHITE = <SGR[97]>
 Set text color to 0xFFFFFFFF.

BG_GRAY = <SGR[100]>
 Set background color to 0x808080.

BG_HI_RED = <SGR[101]>
 Set background color to 0xFF0000.

BG_HI_GREEN = <SGR[102]>
 Set background color to 0x00FF00.

BG_HI_YELLOW = <SGR[103]>
 Set background color to 0xFFFF00.

BG_HI_BLUE = <SGR[104]>
 Set background color to 0x0000FF.

BG_HI_MAGENTA = <SGR[105]>
 Set background color to 0xFF00FF.

BG_HI_CYAN = <SGR[106]>
 Set background color to 0x00FFFF.

BG_HI_WHITE = <SGR[107]>
 Set background color to 0xFFFFFFFF.

HYPERLINK = <OSC[8]>

Create a hyperlink in the text (*supported by limited amount of terminals*). Note that for a working hyperlink you'll need two sequences, not just one.

See also:

[`make_hyperlink_part\(\)`](#) and [`assemble_hyperlink\(\)`](#).

`pytermor.ansi.get_closing_seq(opening_seq)`

Parameters

opening_seq ([`SequenceSGR`](#)) –

Returns

Return type

[`SequenceSGR`](#)

`pytermor.ansi.enclose(opening_seq, string)`

Parameters

- **opening_seq** ([`SequenceSGR`](#)) –
- **string** (*str*) –

Returns

Return type

str

`pytermor.ansi.make_set_cursor_x_abs(x=1)`

Create CHA sequence that sets cursor horizontal position, or column, to **x**.

Parameters

x (*int*) – New cursor horizontal position.

Example

ESC [1G

Return type

[`SequenceCSI`](#)

`pytermor.ansi.make_erase_in_line(mode=0)`

Create EL sequence that erases a part of the line or the entire line. Cursor position does not change.

Parameters

mode (*int*) – Sequence operating mode.

- If set to 0, clear from cursor to the end of the line.
- If set to 1, clear from cursor to beginning of the line.
- If set to 2, clear the entire line.

Example

ESC [0K

Return type

[`SequenceCSI`](#)

`pytermor.ansi.make_query_cursor_position()`

Create QCP sequence that requests an output device to respond with a structure containing current cursor coordinates ([`RCP`](#)).

Warning: Sending this sequence to the terminal may **block** infinitely. Consider using a thread or set a timeout for the main thread using a signal.

Example

ESC [6n

Return type[SequenceCSI](#)`pytermor.ansi.decompose_request_cursor_position(string)`

Parse RCP sequence that generally comes from a terminal as a response to [QCP](#) sequence and contains a cursor's current row and column.

Note: As the library in general provides sequence assembling methods, but not the disassembling ones, there is no dedicated class for RCP sequences yet.

```
>>> decompose_request_cursor_position('[18;2R')
(18, 2)
```

Parameters**string** (*str*) – Terminal response with a sequence.**Returns**Current row and column if the expected sequence exists in *string*, *None* otherwise.**Return type***Optional[Tuple[int, int]]*`pytermor.ansi.make_color_256(code, bg=False)`

Wrapper for creation of [SequenceSGR](#) that sets foreground (or background) to one of 256-color palette value.:

```
>>> make_color_256(141)
<SGR[38, 5, 141]>
```

See also:[Color256](#) class.**Parameters**

- **code** (*int*) – Index of the color in the palette, 0 – 255.
- **bg** (*bool*) – Set to *True* to change the background color (default is foreground).

Example

ESC [38;5;141m

Return type[SequenceSGR](#)`pytermor.ansi.make_color_rgb(r, g, b, bg=False)`

Wrapper for creation of [SequenceSGR](#) operating in True Color mode (16M). Valid values for *r*, *g* and *b* are in range of [0; 255]. This range linearly translates into [0x00; 0xFF] for each channel. The result value is composed as “0xRRGGBB”. For example, sequence with color of 0xFF3300 can be created with:

```
>>> make_color_rgb(255, 51, 0)
<SGR[38, 2, 255, 51, 0]>
```

See also:[ColorRGB](#) class.**Parameters**

- **r** (*int*) – Red channel value, 0 – 255.
- **g** (*int*) – Blue channel value, 0 – 255.
- **b** (*int*) – Green channel value, 0 – 255.
- **bg** (*bool*) – Set to *True* to change the background color (default is foreground).

Example

```
ESC [38;2;255;51;0m
```

Return type

[SequenceSGR](#)

```
pytermor.ansi.make_hyperlink_part(url=None)
```

Parameters

url (*Optional[str]*) –

Example

```
ESC ]8;;http://localhost ESC \
```

Return type

[SequenceOSC](#)

```
pytermor.ansi.assemble_hyperlink(url, label=None)
```

Parameters

- **url** (*str*) –
- **label** (*Optional[str]*) –

Example

```
ESC ]8;;http://localhost ESC \Text ESC ]8;; ESC \
```

Return type

str

2.2 pytermor.color

Color main classes and helper functions.

Module Attributes

CDT	CDT (Color descriptor type) represents a RGB color value.
CT	Any non-abstract <code>IColor</code> type.
NOOP_COLOR	Special <code>IColor</code> instance always rendering into empty string.
DEFAULT_COLOR	Special <code>IColor</code> instance rendering to SGR sequence telling the terminal to reset fg or bg color; same for TmuxRenderer .

Functions

<code>approximate(hex_value[, color_type, max_results])</code>	Search for nearest to <code>hex_value</code> colors of specified <code>color_type</code> and return the first <code>max_results</code> of them.
<code>find_closest(hex_value[, color_type])</code>	Search and return nearest to <code>hex_value</code> instance of specified <code>color_type</code> .
<code>resolve_color(subject[, color_type])</code>	Case-insensitive search through registry contents.

Classes

<code>ApxResult(color, distance)</code>	Approximation result.
<code>Color16(hex_value, code_fg, code_bg[, name, ...])</code>	Variant of a <code>IColor</code> operating within the most basic color set -- Xterm-16 .
<code>Color256(hex_value, code[, name, register, ...])</code>	Variant of a <code>IColor</code> operating within relatively modern Xterm-256 indexed color table.
<code>ColorRGB(hex_value[, name, register, index, ...])</code>	Variant of a <code>IColor</code> operating within RGB color space.
<code>DefaultColor()</code>	
<code>IColor(hex_value[, name])</code>	Abstract superclass for other Colors.

Exceptions

<code>ColorCodeConflictError(code, existing_color, ...)</code>
<code>ColorNameConflictError(tokens, ...)</code>

pytermor.color.CDT

CDT represents a RGB color value. Primary handler is `resolve_color()`. Valid values include:

- *str* with a color name in any form distinguishable by the color resolver; the color lists can be found at: *ANSI preset list* and *ColorRGB collection*;
- *str* starting with a “#” and consisting of 6 more hexadecimal characters, case insensitive (RGB regular form), e.g. “#0B0CCA”;
- *str* starting with a “#” and consisting of 3 more hexadecimal characters, case insensitive (RGB short form), e.g. “#666”;
- *int* in a [0; 0xFFFFFFFF] range.

alias of `TypeVar('CDT', int, str)`

pytermor.color.CT

Any non-abstract `IColor` type.

alias of `TypeVar('CT', bound=IColor)`

class `pytermor.color.ApxResult(color, distance)`

Bases: `Generic[CT]`

Approximation result.

color: CT

Found IColor instance.

distance: int

Squared sRGB distance from this instance to the approximation target.

property distance_real: float

Actual distance from instance to target:

$$distance_{real} = \sqrt{distance}$$

class pytermor.color.Color16(hex_value, code_fg, code_bg, name=None, *, register=False, index=False, aliases=None)

Bases: IColor

Variant of a IColor operating within the most basic color set – **Xterm-16**. Represents basic color-setting SGRs with primary codes 30-37, 40-47, 90-97 and 100-107 (see [Color16 presets](#)).

Note: Arguments register, index and aliases are *kwonly*-type args.

Parameters

- **hex_value** (int) – Color RGB value, e.g. 0x800000.
- **code_fg** (int) – Int code for a foreground color setup, e.g. 30.
- **code_bg** (int) – Int code for a background color setup. e.g. 40.
- **name** (str) – Name of the color, e.g. “red”.
- **register** (bool) – If *True*, add color to registry for resolving by name.
- **index** (bool) – If *True*, add color to approximation index.
- **aliases** (list[str]) – Alternative color names (used in [resolve_color\(\)](#)).

property code_fg: int

Int code for a foreground color setup, e.g. 30.

property code_bg: int

Int code for a background color setup. e.g. 40.

classmethod get_by_code(code)

Get a [Color16](#) instance with specified code. Only *foreground* (=text) colors are indexed, therefore it is impossible to look up for a [Color16](#) with given background color.

Parameters

code (int) – Foreground integer code to look up for (see [Color16 presets](#)).

Raises

KeyError – If no color with specified code is found.

Return type

[Color16](#)

to_sgr(bg, upper_bound=None)

Make an [SGR sequence](#) out of IColor. Used by [SgrRenderer](#).

Parameters

- **bg** (bool) – Set to *True* if required SGR should change the background color, or *False* for the foreground (=text) color.

- **upper_bound** (*Optional*[*Type*[*pytermor.color.IColor*]]) – Required result *IColor* type upper boundary, i.e., the maximum acceptable color class, which will be the basis for SGR being made. See [Color256.to_sgr\(\)](#) for the details.

Return type[SequenceSGR](#)**to_tmux(bg)**

Make a tmux markup directive, which will change the output color to this color's value (after tmux processes and prints it). Used by [TmuxRenderer](#).

Parameters

bg (*bool*) – Set to *True* if required tmux directive should change the background color, or *False* for the foreground (=text) color.

Return type

str

classmethod approximate(hex_value, max_results=1)

Search for the colors nearest to *hex_value* and return the first *max_results*.

See[color.approximate\(\)](#) for the details**Parameters**

- **hex_value** (*int*) – Target RGB value.
- **max_results** (*int*) – Result limit.

Return type*List*[[ApxResult](#)[*pytermor.color.CT*]]**classmethod find_closest(hex_value)**

Search and return nearest to *hex_value* color instance.

See[color.find_closest\(\)](#) for the details**Parameters**

hex_value (*int*) – Target RGB value.

Return type*pytermor.color.CT***format_value(prefix='0x')**

Format color value as “0xRRGGBB”.

Parameters

prefix (*str*) – Can be customized.

Return type

str

property hex_value: int

Color value, e.g. 0x3AEB0C.

property name: str | None

Color name, e.g. “navy-blue”.

classmethod resolve(name)

Case-insensitive search through registry contents.

See[resolve_color\(\)](#) for the details**Parameters**

name (*str*) – *IColor* name to search for.

Return type

pytermor.color.CT

to_hsv()Wrapper around [hex_to_hsv\(\)](#) for concrete instance.**See**[hex_to_hsv\(\)](#) for the details**Return type***Union*[[HSV](#), *Tuple*[float, float, float]]**to_rgb()**Wrapper around [to_rgb\(\)](#) for concrete instance.**See**[to_rgb\(\)](#) for the details**Return type***Union*[[RGB](#), *Tuple*[int, int, int]]

```
class pytermor.color.Color256(hex_value, code, name=None, *, register=False, index=False,
                               aliases=None, color16_equiv=None)
```

Bases: [IColor](#)

Variant of a [IColor](#) operating within relatively modern **Xterm-256** indexed color table. Represents SGR complex codes 38;5;* and 48;5;* (see [Color256 presets](#)).

Note: Arguments `register`, `index`, `aliases` and `color16_equiv` are *kwonly*-type args.

Parameters

- **hex_value** (*int*) – Color RGB value, e.g. 0x5f0000.
- **code** (*int*) – Int code for a color setup, e.g. 52.
- **name** (*str*) – Name of the color, e.g. “dark-red”.
- **register** (*bool*) – If *True*, add color to registry for resolving by name.
- **index** (*bool*) – If *True*, add color to approximation index.
- **aliases** (*t.List[str]*) – Alternative color names (used in [resolve_color\(\)](#)).
- **color16_equiv** ([Color16](#)) – [Color16](#) counterpart (applies only to codes 0-15).

to_sgr(bg, upper_bound=None)Make an [SGR sequence](#) out of [IColor](#). Used by [SgrRenderer](#).

Each [IColor](#) type represents one SGR type in the context of colors. For example, if `upper_bound` is set to [Color16](#), the resulting SGR will always be one of 16-color index table, even if the original color was of different type – it will be approximated just before the SGR assembling.

The reason for this is the necessity to provide a similar look for all users with different terminal settings/capabilities. When the library sees that user’s output device supports 256 colors only, it cannot assemble True Color SGRs, because they will be ignored (if we are lucky), or displayed in a glitchy way, or mess up the output completely. The good news is that the process is automatic and in most cases the library will manage the transformations by itself. If it’s not the case, the developer can correct the behaviour by overriding the renderers’ output mode. See [SgrRenderer](#) and [OutputMode](#) docs.

Parameters

- **bg** (*bool*) – Set to *True* if required SGR should change the background color, or *False* for the foreground (=text) color.

- **upper_bound** (*Optional*[*Type*[*pytermor.color.IColor*]]) – Required result *IColor* type upper boundary, i.e., the maximum acceptable color class, which will be the basis for SGR being made.

Return type[SequenceSGR](#)**to_tmux(bg)**

Make a tmux markup directive, which will change the output color to this color's value (after tmux processes and prints it). Used by [TmuxRenderer](#).

Parameters

bg (*bool*) – Set to *True* if required tmux directive should change the background color, or *False* for the foreground (=text) color.

Return type

str

property code: int

Int code for a color setup, e.g. 52.

classmethod get_by_code(code)

Get a [Color256](#) instance with specified code (=position in the index).

Parameters

code (*int*) – Color code to look up for (see [Color256 presets](#)).

Raises

KeyError – If no color with specified code is found.

Return type[Color256](#)**classmethod approximate(hex_value, max_results=1)**

Search for the colors nearest to **hex_value** and return the first **max_results**.

See

[color.approximate\(\)](#) for the details

Parameters

- **hex_value** (*int*) – Target RGB value.
- **max_results** (*int*) – Result limit.

Return type*List*[*ApxResult*[*pytermor.color.CT*]]**classmethod find_closest(hex_value)**

Search and return nearest to **hex_value** color instance.

See

[color.find_closest\(\)](#) for the details

Parameters

hex_value (*int*) – Target RGB value.

Return type*pytermor.color.CT***format_value(prefix='0x')**

Format color value as “0xRRGGBB”.

Parameters

prefix (*str*) – Can be customized.

Return type

str

property hex_value: `int`

Color value, e.g. 0x3AEB0C.

property name: `str | None`

Color name, e.g. “navy-blue”.

classmethod resolve(*name*)

Case-insensitive search through registry contents.

See

[`resolve_color\(\)`](#) for the details

Parameters

name (*str*) – IColor name to search for.

Return type

`pytermor.color.CT`

to_hsv()

Wrapper around [`hex_to_hsv\(\)`](#) for concrete instance.

See

[`hex_to_hsv\(\)`](#) for the details

Return type

`Union[HSV, Tuple[float, float, float]]`

to_rgb()

Wrapper around [`to_rgb\(\)`](#) for concrete instance.

See

[`to_rgb\(\)`](#) for the details

Return type

`Union[RGB, Tuple[int, int, int]]`

class `pytermor.color.ColorRGB`(*hex_value*, *name=None*, *, *register=False*, *index=False*, *aliases=None*, *variation_map=None*)

Bases: `IColor`

Variant of a `IColor` operating within RGB color space. Presets include [*es7s named colors*](#), a unique collection of colors compiled from several known sources after careful selection. However, it’s not limited to aforementioned color list and can be easily extended.

Note: Arguments `register`, `index`, `aliases` and `variation_map` are *kwonly*-type args.

Parameters

- **hex_value** (*int*) – Color RGB value, e.g. 0x73A9C2.
- **name** (*str*) – Name of the color, e.g. “moonstone-blue”.
- **register** (*bool*) – If *True*, add color to registry for resolving by name.
- **index** (*bool*) – If *True*, add color to approximation index.
- **aliases** (*t.List[str]*) – Alternative color names (used in [`resolve_color\(\)`](#)).
- **variation_map** (*t.Dict[int, str]*) – Mapping {*int*: *str*}, where keys are hex values, and values are variation names.

to_sgr(*bg*, *upper_bound=None*)

Make an [*SGR sequence*](#) out of `IColor`. Used by [`SgrRenderer`](#).

Parameters

- **bg** (*bool*) – Set to *True* if required SGR should change the background color, or *False* for the foreground (=text) color.
- **upper_bound** (*Optional[Type[pytermor.color.IColor]]*) – Required result IColor type upper boundary, i.e., the maximum acceptable color class, which will be the basis for SGR being made. See [Color256.to_sgr\(\)](#) for the details.

Return type

SequenceSGR

to_tmux(bg)

Make a tmux markup directive, which will change the output color to this color's value (after tmux processes and prints it). Used by [TmuxRenderer](#).

Parameters

bg (*bool*) – Set to *True* if required tmux directive should change the background color, or *False* for the foreground (=text) color.

Return type

str

property base: CT | None

Parent color for color variations. Empty for regular colors.

property variations: Dict[str, pytermor.color.CT]

List of color variations. *Variation* of a color is a similar color with almost the same name, but with differing suffix. The main idea of variations is to provide a basis for fuzzy searching, which will return several results for one query; i.e., when the query matches a color with variations, the whole color family can be considered a match, which should increase searching speed.

classmethod approximate(hex_value, max_results=1)

Search for the colors nearest to **hex_value** and return the first **max_results**.

See

[color.approximate\(\)](#) for the details

Parameters

- **hex_value** (*int*) – Target RGB value.
- **max_results** (*int*) – Result limit.

Return type

List[ApxResult[pytermor.color.CT]]

classmethod find_closest(hex_value)

Search and return nearest to **hex_value** color instance.

See

[color.find_closest\(\)](#) for the details

Parameters

hex_value (*int*) – Target RGB value.

Return type

pytermor.color.CT

format_value(prefix='0x')

Format color value as “0xRRGGBB”.

Parameters

prefix (*str*) – Can be customized.

Return type

str

property hex_value: `int`

Color value, e.g. 0x3AEB0C.

property name: `str | None`

Color name, e.g. “navy-blue”.

classmethod resolve(*name*)

Case-insensitive search through registry contents.

See

[resolve_color\(\)](#) for the details

Parameters

name (*str*) – IColor name to search for.

Return type

`pytermor.color.CT`

to_hsv()

Wrapper around [hex_to_hsv\(\)](#) for concrete instance.

See

[hex_to_hsv\(\)](#) for the details

Return type

`Union[HSV, Tuple[float, float, float]]`

to_rgb()

Wrapper around [to_rgb\(\)](#) for concrete instance.

See

[to_rgb\(\)](#) for the details

Return type

`Union[RGB, Tuple[int, int, int]]`

`pytermor.color.NOOP_COLOR = <_NoopColor[NOP]>`

Special IColor instance always rendering into empty string.

`pytermor.color.DEFAULT_COLOR = <DefaultColor[DEF]>`

Special IColor instance rendering to SGR sequence telling the terminal to reset fg or bg color; same for [TmuxRenderer](#). Useful when you inherit some [Style](#) with fg or bg color which you don’t need, but at the same time you don’t actually want to set up any value whatsoever.

Important: *None* and [NOOP_COLOR](#) are always treated as placeholders for fallback values, i.e., they can’t be used as *resetters* – that’s what [DEFAULT_COLOR](#) is for.

```
>>> DEFAULT_COLOR.to_sgr(bg=False)
<SGR[39]>
```

`pytermor.color.resolve_color(subject, color_type=None)`

Case-insensitive search through registry contents. Search is performed for IColor instance with name *subject* if the *color_type* registry. If *color_type* is omitted, all the registries will be requested in this order: [[Color16](#), [Color256](#), [ColorRGB](#)]. Should any registry return a match, the resolving is stopped and the result is returned.

```
>>> resolve_color('red')
<Color16[#31,8000000?,red]>
```

If *color_type* is [ColorRGB](#) or *None*, one more way to specify a color is supported. *subject* should be:

- 1) in full hexadecimal form as *str*: “#RRGGBB”,

- 2) in short hexadecimal form as *str*: “#RGB”,
- 3) as an integer in [0x000000; 0xFFFFFFFF] range.

Note that ‘#’ in the beginning of the string is essential, as it tells the resolver to parse a string instead of invoking the registry.

Important: In this case no actual searching is performed, and a new nameless instance of [ColorRGB](#) is created and returned. This instance will be a “unbound” color, i.e. it does not end up in a registry or index, thus it can’t be resolved by name and can’t be used in approximation procedures.

```
>>> resolve_color("#333")
<ColorRGB[333333]>
>>> resolve_color(0xfafef0)
<ColorRGB[FAFEF0]>
```

Color names are stored in registries as tokens, which allows to use any form of input and get the correct result regardless. The only requirement is to split the words in any matter, so that tokenizer could distinguish the words from each other:

```
>>> resolve_color('deep-sky-blue-7')
<Color256[X23,005F5F,deep-sky-blue-7]>
>>> resolve_color('DEEP_SKY_BLUE_7')
<Color256[X23,005F5F,deep-sky-blue-7]>
>>> resolve_color('DeepSkyBlue7')
<Color256[X23,005F5F,deep-sky-blue-7]>
```

```
>>> resolve_color('deepskyblue7')
Traceback (most recent call last):
LookupError: Color 'deepskyblue7' was not found in any of registries
```

Parameters

- **subject** (*str/int*) – IColor name or hex value to search for. See [CDT](#).
- **color_type** (*Optional[Type[pytermor.color.CT]]*) – Target color type ([Color16](#), [Color256](#) or [ColorRGB](#)).

Raises

LookupError – If nothing was found in either of registries.

Returns

IColor instance with specified name or value.

Return type

pytermor.color.CT

pytermor.color.find_closest(*hex_value*, *color_type=None*)

Search and return nearest to *hex_value* instance of specified *color_type*. If *color_type* is omitted, search for the closest [Color256](#) element.

Method is useful for finding applicable color alternatives if user’s terminal is incapable of operating in more advanced mode. Usually it is done by the library automatically and transparently for both the developer and the end-user.

Note: This method caches the results, i.e., the same search query will from then onward result in the same return value without the necessity of iterating through the color index. If that’s not applicable, use similar method [approximate\(\)](#), which is unaware of caching mechanism altogether.

Parameters

- **hex_value** (*int*) – Target color RGB value.
- **color_type** (*Optional[Type[pytermor.color.CT]]*) – Target color type (*Color16*, *Color256* or *ColorRGB*).

Returns

Nearest to hex_value color instance of specified type.

Return type

pytermor.color.CT

`pytermor.color.approximate(hex_value, color_type=None, max_results=1)`

Search for nearest to hex_value colors of specified color_type and return the first max_results of them. If color_type is omitted, search for the closest *Color256* elements. This method is similar to the *find_closest()*, although they differ in some aspects:

- *approximate()* can return more than one result;
- *approximate()* returns not just a IColor instance(s), but also a number equal to squared distance to the target color for each of them;
- *find_closest()* caches the results, while *approximate()* ignores the cache completely.

Parameters

- **hex_value** (*int*) – Target color RGB value.
- **color_type** (*Optional[Type[pytermor.color.CT]]*) – Target color type (*Color16*, *Color256* or *ColorRGB*).
- **max_results** (*int*) – Return no more than max_results items.

Returns

Pairs of closest IColor instance(s) found with their distances to the target color, sorted by distance descending, i.e., element at index 0 is the closest color found, paired with its distance to the target; element with index 1 is second-closest color (if any) and corresponding distance value, etc.

Return type

List[ApxResult[pytermor.color.CT]]

exception `pytermor.color.ColorNameConflictError(tokens, existing_color, new_color)`

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception `pytermor.color.ColorCodeConflictError(code, existing_color, new_color)`

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

2.3 pytermor.common

Shared code suitable for the package as well as any other.

Module Attributes

<i>RGB</i> (red, green, blue)	RGB.
<i>HSV</i> (hue, saturation, value)	HSV.
<i>ALIGN_LEFT</i>	Left align (add padding on the right side, if necessary).
<i>ALIGN_RIGHT</i>	Right align (add padding on the left side, if necessary).
<i>ALIGN_CENTER</i>	Center align (add paddings on both sides evenly, if necessary).

Functions

<i>chunk</i> (items, size)	Split item list into chunks of size <i>size</i> and return these chunks as <i>tuples</i> .
<i>flatten</i> (items)	
<i>flatten1</i> (items)	Take a list of nested lists and unpack all nested elements one level up.
<i>get_preferable_wrap_width</i> ([force_width])	Return preferable terminal width for comfort reading of wrapped text (max=120).
<i>get_qname</i> (obj)	Convenient method for getting a class name for class instances as well as for the classes themselves.
<i>get_terminal_width</i> ([fallback, pad])	Return current terminal width with an optional "safety buffer", which ensures that no unwanted line wrapping will happen.
<i>median</i> (N[, key])	Find the median of a list of values.
<i>percentile</i> (N, percent[, key])	Find the percentile of a list of values.

Classes

<i>Align</i> (value)	Align type.
<i>ExtendedEnum</i> (value)	Standard Enum with a few additional methods on top.
<i>HSV</i> (hue, saturation, value)	HSV.
<i>RGB</i> (red, green, blue)	RGB.

Exceptions

`ArgCountError(actual, *expected)`

`ArgTypeError(actual_type[, arg_name, fn])`

ConflictError

LogicError

UserAbort

UserCancel

class `pytermor.common.RGB(red, green, blue)`

Bases: `tuple`

RGB.

blue: `int`

Alias for field number 2

count(*value*, /)

Return number of occurrences of value.

green: `int`

Alias for field number 1

index(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises `ValueError` if the value is not present.

red: `int`

Alias for field number 0

class `pytermor.common.HSV(hue, saturation, value)`

Bases: `tuple`

HSV.

count(*value*, /)

Return number of occurrences of value.

hue: `float`

Alias for field number 0

index(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises `ValueError` if the value is not present.

saturation: `float`

Alias for field number 1

value: `float`

Alias for field number 2

class pytermor.common.**ExtendedEnum**(*value*)

Bases: Enum

Standard Enum with a few additional methods on top.

classmethod list()

Return all enum values as list.

```
>>> Align.list()
['<', '>', '^']
```

classmethod dict()

Return mapping of all enum keys to corresponding enum values.

```
>>> Align.dict()
{<Align.LEFT: '<': '<', <Align.RIGHT: '>': '>', <Align.CENTER: '^': '^'}
```

class pytermor.common.**Align**(*value*)

Bases: str, *ExtendedEnum*

Align type.

exception pytermor.common.**UserCancel**

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception pytermor.common.**UserAbort**

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception pytermor.common.**LogicError**

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

exception pytermor.common.**ConflictError**

Bases: Exception

with_traceback()

Exception.with_traceback(tb) – set self.__traceback__ to tb and return self.

pytermor.common.**ALIGN_LEFT** = **Align.LEFT**

Left align (add padding on the right side, if necessary).

pytermor.common.**ALIGN_RIGHT** = **Align.RIGHT**

Right align (add padding on the left side, if necessary).

pytermor.common.**ALIGN_CENTER** = **Align.CENTER**

Center align (add paddings on both sides evenly, if necessary).

pytermor.common.**get_qname**(*obj*)

Convenient method for getting a class name for class instances as well as for the classes themselves. Suitable for debug output in `__repr__` methods, for example.

```
>>> get_qname("aaa")
'str'
>>> get_qname(threading.Thread)
'Thread'
```

Return type

str

`pytermor.common.get_terminal_width(fallback=80, pad=2)`

Return current terminal width with an optional “safety buffer”, which ensures that no unwanted line wrapping will happen.

Parameters

- **fallback** (*int*) – Default value when shutil is unavailable and environment variable COLUMNS is unset.
- **pad** (*int*) – Additional safety space to prevent unwanted line wrapping.

Return type

int

`pytermor.common.get_preferable_wrap_width(force_width=None)`

Return preferable terminal width for comfort reading of wrapped text (max=120).

Parameters

force_width (*Optional[int]*) – Ignore current terminal width and use this value as a result.

Return type

int

`pytermor.common.chunk(items, size)`

Split item list into chunks of size *size* and return these chunks as *tuples*.

```
>>> for c in chunk(range(5), 2):
...     print(c)
(0, 1)
(2, 3)
(4,)
```

Parameters

- **items** (*Iterable[T]*) – Input elements.
- **size** (*int*) – Chunk size.

Return type*Iterator[Tuple[T, ...]]*

`pytermor.common.flatten1(items)`

Take a list of nested lists and unpack all nested elements one level up.

```
>>> flatten1([[1, 2, 3], [4, 5, 6], [[10, 11, 12]]])
[1, 2, 3, 4, 5, 6, [10, 11, 12]]
```

Parameters

items (*Iterable[Iterable[T]]*) – Input lists.

Return type*List[T]*

`pytermor.common.flatten(items)`

Todo: recursive

Return type*List[T]*`pytermor.common.percentile(N, percent, key=<function <lambda>>)`

Find the percentile of a list of values.

Parameters

- **N** (*Sequence[float]*) – List of values. MUST BE already sorted.
- **percent** (*float*) – Float value from 0.0 to 1.0.
- **key** (*Callable[[float], float]*) – Optional key function to compute value from each element of N.

Return type*float*`pytermor.common.median(N, key=<function <lambda>>)`Find the median of a list of values. Wrapper around [percentile\(\)](#) with fixed `percent` argument (=0.5).**Parameters**

- **N** (*Sequence[float]*) – List of values. MUST BE already sorted.
- **key** (*Callable[[float], float]*) – Optional key function to compute value from each element of N.

Return type*float*

2.4 pytermor.config

Library fine tuning.

Functions

<code>get_config()</code>	Return the current config instance.
<code>init_config()</code>	Reset all config vars to default values.
<code>replace_config(cfg)</code>	Replace the global config instance with provided one.

Classes

<code>Config([renderer_class, output_mode, ...])</code>	Configuration variables container.
---	------------------------------------

class `pytermor.config.Config(renderer_class=<factory>, output_mode=<factory>, trace_renders=<factory>, prefer_rgb=<factory>)`

Configuration variables container. Values can be modified in two ways:

- 1) create new [Config](#) instance from scratch and activate with [`replace_config\(\)`](#);
- 2) or preliminarily set the corresponding environment variables to intended values, and the default config instance will catch them up on initialization.

See also:Environment variable list is located in [Configuration](#) guide section.**Parameters**

- **renderer_class** (*str*) – `renderer_class`
- **output_mode** (*str*) – `output_mode`
- **trace_renderers** (*bool*) – Set to *True* to log hex dumps of rendered strings. Note that default logger is `logging.NullHandler` with `WARNING` level, so in order to see the traces attached handler is required.
- **prefer_rgb** (*bool*) – By default SGR renderer transforms *Color256* instances to ESC `[38;5;<N>m` sequences even if True Color support is detected. With this flag set to *True*, the behaviour is different, and *Color256* will be rendered as ESC `[38;2;<R>;<G>;m` sequence (if True Color is available).

`pytermor.config.get_config()`

Return the current config instance.

Return type

Config

`pytermor.config.init_config()`

Reset all config vars to default values.

`pytermor.config.replace_config(cfg)`

Replace the global config instance with provided one.

2.5 pytermor.cval

Color preset list:

- 16x *Color16* (16 unique)
- 256x *Color256* (247 unique)
- 1647x *ColorRGB* (1642 unique)

Classes

CVAL()

class `pytermor.cval.CVAL`

2.6 pytermor.renderer

Output formatters. Default global renderer type is *SgrRenderer*.

Functions

`init_renderer()`

Classes

<code>HtmlRenderer()</code>	Translate <i>Styles</i> attributes into a rudimentary HTML markup.
<code>IRenderer()</code>	Renderer interface.
<code>NoOpRenderer()</code>	Special renderer type that does nothing with the input string and just returns it as is (i.e.
<code>OutputMode(value)</code>	Determines what types of SGR sequences are allowed to use in the output.
<code>RendererManager()</code>	Class for global rendering mode setup.
<code>SgrDebugger([output_mode])</code>	Subclass of regular <i>SgrRenderer</i> with two differences -- instead of rendering the proper ANSI escape sequences it renders them with ESC character replaced by "", and encloses the whole sequence into '()' for visual separation.
<code>SgrRenderer([output_mode, io])</code>	Default renderer invoked by <i>Text.render()</i> .
<code>TmuxRenderer()</code>	Translates <i>Styles</i> attributes into <i>tmux-compatible</i> ⁷ markup.

class pytermor.renderer.RendererManager

Class for global rendering mode setup.

Selecting the renderer can be accomplished in several ways:

- By using general-purpose functions *text.render()* and *text.echo()* – both have an argument *renderer* (preferable; introduced in pytermor 2.x).
- Method *RendererManager.set_default()* sets the default renderer globally. After that calling *text.render()* will automatically invoke a said renderer and apply the required formatting (that is, if *renderer* argument is left empty).
- Alternatively, you can use renderer's instance method *render()* directly and avoid messing up with the manager, but that's not recommended and possibly will be deprecated in future versions).

Generally speaking, if you need to invoke a custom renderer just once, it's convenient to use the first method for this matter, and use the second one in all the other cases.

On the contrary, if there is a necessity to use more than one renderer alternately, it's better to avoid using the global one at all, and just instantiate and invoke both renderers independently.

TL;DR

To unconditionally print formatted message to standard output, use *RendererManager.set_default_format_always()* and then *render()*.

classmethod *set_default(renderer=None)*

Select a global renderer.

Parameters

renderer (*Optional[Union[IRenderer, Type[IRenderer]]]*) – Default renderer to use globally. Calling this method without arguments will result in library default renderer *SgrRenderer* being set as default.

⁷ <https://man7.org/linux/man-pages/man1/tmux.1.html#STYLES>

All the methods with the `renderer` argument (e.g., `text.render()`) will use the global default one if said argument is omitted or set to `None`.

You can specify either the renderer class, in which case manager will instantiate it with the default parameters, or provide already instantiated and set up renderer, which will be registred as global.

classmethod `get_default()`

Get global renderer instance (*SgrRenderer*, or the one provided earlier with `set_default()`).

Return type

IRenderer

classmethod `set_default_format_always()`

Shortcut for forcing all control sequences to be present in the output of a global renderer.

Note that it applies only to the renderer that is set up as default at the moment of calling this method, i.e., all previously created instances, as well as the ones that will be created afterwards, are unaffected.

classmethod `set_default_format_never()`

Shortcut for disabling all output formatting of a global renderer.

class `pytermor.renderer.IRenderer`

Renderer interface.

abstract property `is_caching_allowed: bool`

Class-level property.

Returns

True if caching of renderer's results makes any sense and *False* otherwise.

abstract property `is_format_allowed: bool`

Returns

True if renderer is set up to use the formatting and will do it on invocation, and *False* otherwise.

abstract `render(string, fmt=None)`

Apply colors and attributes described in `fmt` argument to `string` and return the result. Output format depends on renderer's class, which defines the implementation.

Parameters

- **string** (*str*) – String to format.
- **fmt** (*Optional[pytermor.style.FT]*) – Style or color to apply. If `fmt` is a *IColor* instance, it is assumed to be a foreground color. See [FT](#).

Returns

String with formatting applied, or without it, depending on renderer settings.

Return type

str

abstract `clone(*args, **kwargs)`

Make a copy of the renderer with the same setup.

Return type

self

class `pytermor.renderer.OutputMode(value)`

Bases: *Enum*

Determines what types of SGR sequences are allowed to use in the output.

NO_ANSI = 'no_ansi'

The renderer discards all color and format information completely.

XTERM_16 = 'xterm_16'

16-colors mode. Enforces the renderer to approximate all color types to [Color16](#) and render them as basic mode selection SGR sequences (ESC [31m, ESC [42m etc). See [Color.approximate\(\)](#) for approximation algorithm details.

XTERM_256 = 'xterm_256'

256-colors mode. Allows the renderer to use either [Color16](#) or [Color256](#) (but RGB will be approximated to 256-color palette).

TRUE_COLOR = 'true_color'

RGB color mode. Does not apply restrictions to color rendering.

AUTO = 'auto'

Lets the renderer select the most suitable mode by itself. See [SgrRenderer](#) constructor documentation for the details.

```
class pytermor.renderer.SgrRenderer(output_mode=OutputMode.AUTO, io=<_io.TextIOWrapper
                                     name='<stdout>' mode='w' encoding='utf-8'>)
```

Bases: [IRenderer](#)

Default renderer invoked by [Text.render\(\)](#). Transforms [IColor](#) instances defined in `style` into ANSI control sequence bytes and merges them with input string. Type of resulting [SequenceSGR](#) depends on type of [IColor](#) instances in `style` argument and current output mode of the renderer.

1. [ColorRGB](#) can be rendered as True Color sequence, 256-color sequence or 16-color sequence depending on specified [OutputMode](#) and config variable `Config.prefer_rgb`.
2. [Color256](#) can be rendered as 256-color sequence or 16-color sequence.
3. [Color16](#) will be rendered as 16-color sequence.
4. Nothing of the above will happen and all formatting will be discarded completely if output device is not a terminal emulator or if the developer explicitly set up the renderer to do so ([OutputMode.NO_ANSI](#)).

Renderer approximates RGB colors to closest **indexed** colors if terminal doesn't support RGB output. In case terminal doesn't support even 256 colors, it falls back to 16-color palette and picks closest samples again the same way. See [OutputMode](#) documentation for exact mappings.

```
>>> SgrRenderer(OutputMode.XTERM_256).render('text', Styles.WARNING_LABEL)
'[1;33mtext[22;39m'
>>> SgrRenderer(OutputMode.NO_ANSI).render('text', Styles.WARNING_LABEL)
'text'
```

Parameters

output_mode ([OutputMode](#)) – SGR output mode to use. Valid values are listed in [OutputMode](#) enum.

With [OutputMode.AUTO](#) the renderer will first check if the output device is a terminal emulator, and use [OutputMode.NO_ANSI](#) when it is not. Otherwise, the renderer will read TERM environment variable and follow these rules:

- [OutputMode.NO_ANSI](#) if TERM is set to xterm.
- [OutputMode.XTERM_16](#) if TERM is set to xterm-color.
- [OutputMode.XTERM_256](#) in all other cases.

Special case is when TERM equals to xterm-256color **and** COLORTERM is either truecolor or 24bit, then [OutputMode.TRUE_COLOR](#) will be used.

property is_caching_allowed: bool

Class-level property.

Returns

True if caching of renderer's results makes any sense and *False* otherwise.

property is_format_allowed: bool

Returns

True if renderer is set up to use the formatting and will do it on invocation, and *False* otherwise.

render(*string*, *fmt=None*)

Apply colors and attributes described in *fmt* argument to *string* and return the result. Output format depends on renderer's class, which defines the implementation.

Parameters

- **string** (*str*) – String to format.
- **fmt** (*Optional*[*pytermor.style.FT*]) – Style or color to apply. If *fmt* is a *IColor* instance, it is assumed to be a foreground color. See [FT](#).

Returns

String with formatting applied, or without it, depending on renderer settings.

Return type

str

clone()

Make a copy of the renderer with the same setup.

Return type

self

class `pytermor.renderer.TmuxRenderer`

Bases: [IRenderer](#)

Translates [Styles](#) attributes into [tmux-compatible](#)⁸ markup. [tmux](#)⁹ is a commonly used terminal multiplexer.

```
>>> TmuxRenderer().render('text', Style(fg='blue', bold=True))
'#[fg=blue bold]text#[fg=default nobold]'
```

property is_caching_allowed: bool

Class-level property.

Returns

True if caching of renderer's results makes any sense and *False* otherwise.

property is_format_allowed: bool

Returns

Always *True*, because *tmux* markup can be used without regard to the type of output device and its capabilities – all the dirty work will be done by the multiplexer itself.

render(*string*, *fmt=None*)

Apply colors and attributes described in *fmt* argument to *string* and return the result. Output format depends on renderer's class, which defines the implementation.

Parameters

- **string** (*str*) – String to format.
- **fmt** (*Optional*[*pytermor.style.FT*]) – Style or color to apply. If *fmt* is a *IColor* instance, it is assumed to be a foreground color. See [FT](#).

Returns

String with formatting applied, or without it, depending on renderer settings.

Return type

str

clone()

Make a copy of the renderer with the same setup.

Return type

self

class pytermor.renderer.NoOpRenderer

Bases: *IRenderer*

Special renderer type that does nothing with the input string and just returns it as is (i.e. raw text without any *Styles* applied. Often used as a default argument value (along with similar “NoOps” like *NOOP_STYLE*, *NOOP_COLOR* etc.)

```
>>> NoOpRenderer().render('text', Style(fg='green', bold=True))
'text'
```

property is_caching_allowed: bool

Class-level property.

Returns

True if caching of renderer’s results makes any sense and *False* otherwise.

property is_format_allowed: bool**Returns**

Nothing to apply → nothing to allow, thus the returned value is always *False*.

render(string, fmt=None)

Return the *string* argument untouched, don’t mind the *fmt*.

Parameters

- **string** (*str*) – String to format ignore.
- **fmt** (*Optional[pytermor.style.FT]*) – Style or color to appl discard.

Return type

str

clone()

Make a copy of the renderer with the same setup.

Return type

self

class pytermor.renderer.HtmlRenderer

Bases: *IRenderer*

Translate *Styles* attributes into a rudimentary HTML markup. All the formatting is inlined into *style* attribute of the `` elements. Can be optimized by extracting the common styles as CSS classes and referencing them by DOM elements instead.

```
>>> HtmlRenderer().render('text', Style(fg='red', bold=True))
'<span style="color: #800000; font-weight: 700">text</span>'
```

⁸ <https://man7.org/linux/man-pages/man1/tmux.1.html#STYLES>

⁹ <https://github.com/tmux/tmux>

property is_caching_allowed: bool

Class-level property.

Returns

True if caching of renderer's results makes any sense and *False* otherwise.

property is_format_allowed: bool

Returns

Always *True*, because the capabilities of the terminal have nothing to do with HTML markup meant for web-browsers.

render(*string*, *fmt=None*)

Apply colors and attributes described in *fmt* argument to *string* and return the result. Output format depends on renderer's class, which defines the implementation.

Parameters

- **string** (*str*) – String to format.
- **fmt** (*Optional*[*pytermor.style.FT*]) – Style or color to apply. If *fmt* is a *IColor* instance, it is assumed to be a foreground color. See [FT](#).

Returns

String with formatting applied, or without it, depending on renderer settings.

Return type

str

clone()

Make a copy of the renderer with the same setup.

Return type

self

class `pytermor.renderer.SgrDebugger` (*output_mode=OutputMode.AUTO*)

Bases: [SgrRenderer](#)

Subclass of regular [SgrRenderer](#) with two differences – instead of rendering the proper ANSI escape sequences it renders them with ESC character replaced by “”, and encloses the whole sequence into ‘()’ for visual separation.

Can be used for debugging of assembled sequences, because such a transformation reliably converts a control sequence into a harmless piece of bytes completely ignored by the terminals.

```
>>> SgrDebugger(OutputMode.XTERM_16).render('text', Style(fg='red', bold=True))
'([1;31m)text([22;39m)'
```

property is_caching_allowed: bool

Class-level property.

Returns

True if caching of renderer's results makes any sense and *False* otherwise.

property is_format_allowed: bool

Returns

True if renderer is set up to use the formatting and will do it on invocation, and *False* otherwise.

render(*string*, *fmt=None*)

Apply colors and attributes described in *fmt* argument to *string* and return the result. Output format depends on renderer's class, which defines the implementation.

Parameters

- **string** (*str*) – String to format.
- **fmt** (*Optional* [*pytermor.style.FT*]) – Style or color to apply. If **fmt** is a *IColor* instance, it is assumed to be a foreground color. See [FT](#).

Returns

String with formatting applied, or without it, depending on renderer settings.

Return type

str

clone()

Make a copy of the renderer with the same setup.

Return type

self

set_format_always()

Force all control sequences to be present in the output.

set_format_auto()

Reset the force formatting flag and let the renderer decide by itself (see [SgrRenderer](#) docs for the details).

set_format_never()

Force disabling of all output formatting.

2.7 pytermor.style

Todo: S

Module Attributes

FT	FT (Format type) is a style descriptor.
NOOP_STYLE	Special style passing the text through without any modifications.

Functions

make_style ([fmt])	General Style constructor.
merge_styles ([base, fallbacks, overwrites])	Bulk style merging method.

Classes

<code>Style([fallback, fg, bg, blink, bold, ...])</code>	Create new text render descriptor.
<code>Styles()</code>	Some ready-to-use styles.

`pytermor.style.FT`

FT is a style descriptor. Used as a shortcut precursor for actual styles. Primary handler is `make_style()`.

alias of `TypeVar('FT', int, str, ~pytermor.color.IColor, Style, None)`

class `pytermor.style.Style(fallback=None, fg=None, bg=None, *, blink=None, bold=None, crosslined=None, dim=None, double_underlined=None, inversed=None, italic=None, overlined=None, underlined=None, class_name=None)`

Create new text render descriptor.

Both `fg` and `bg` can be specified as existing `IColor` instance as well as plain *str* or *int* (for the details see `resolve_color()`).

```
>>> Style(fg='green', bold=True)
<Style[green:NOP +BOLD]>
>>> Style(bg=0x0000ff)
<Style[NOP:0000FF]>
>>> Style(fg='DeepSkyBlue1', bg='gray3')
<Style[X39[00AFFF]:X232[080808]]>
```

Attribute merging from `fallback` works this way:

- If constructor argument is *not* empty (`True`, `False`, `IColor` etc.), keep it as attribute value.
- If constructor argument is empty (`None`), take the value from `fallback`'s corresponding attribute.

See `merge_fallback()` and `merge_overwrite()` methods and take the differences into account. The method used in the constructor is the first one.

Note: Both empty (i.e., `None`) attributes of type `IColor` after initialization will be replaced with special constant `NOOP_COLOR`, which behaves like there was no color defined, and at the same time makes it safer to work with nullable color-type variables. Merge methods are aware of this and treat `NOOP_COLOR` as `None`.

Note: All arguments except `fallback`, `fg` and `bg` are *kwonly*-type args.

Parameters

- **fallback** (`Style`) – Copy unset attributes from specified fallback style. See `merge_fallback()`.
- **fg** (`CDT` | `IColor`) – Foreground (i.e., text) color.
- **bg** (`CDT` | `IColor`) – Background color.
- **blink** (`bool`) – Blinking effect; *supported by limited amount of Renderers*.
- **bold** (`bool`) – Bold or increased intensity.
- **crosslined** (`bool`) – Strikethrough.
- **dim** (`bool`) – Faint, decreased intensity.
- **double_underlined** (`bool`) – Faint, decreased intensity.
- **inversed** (`bool`) – Swap foreground and background colors.
- **italic** (`bool`) – Italic.

- **overlined** (*bool*) – Overline.
- **underlined** (*bool*) – Underline.
- **class_name** (*str*) – Arbitrary string used by some `_get_renderers`, e.g. by `HtmlRenderer`.

autopick_fg()

Pick `fg_color` depending on `bg_color`. Set `fg_color` to either 3% gray (almost black) if background is bright, or to 80% gray (bright gray) if it is dark. If background is `None`, do nothing.

Todo: check if there is a better algorithm, because current thinks text on #000080 should be black

Returns

`self`

Return type

`Style`

flip()

Swap foreground color and background color.

Returns

`self`

Return type

`Style`

clone()**Returns**

`self`

Return type

`Style`

merge_fallback(fallback)

Merge current style with specified `fallback` `style`, following the rules:

1. `self` attribute value is in priority, i.e. when both `self` and `fallback` attributes are defined, keep `self` value.
2. If `self` attribute is `None`, take the value from `fallback`'s corresponding attribute, and vice versa.
3. If both attribute values are `None`, keep the `None`.

All attributes corresponding to constructor arguments except `fallback` are subject to merging. `NOOP_COLOR` is treated like `None` (default for `fg` and `bg`).

Modifies the instance in-place and returns it as well (for chained calls).

Listing 1: Merging different values in fallback mode

	FALLBACK	BASE(SELF)	RESULT	
	+-----+	+-----+	+-----+	
ATTR-1	False --∅	True ==>	True	BASE val is in priority
ATTR-2	True -----	None -->	True	no BASE val, taking FALLBACK val
ATTR-3	None	True ==>	True	BASE val is in priority
ATTR-4	None	None	None	no vals, keeping unset
	+-----+	+-----+	+-----+	

See also:

`merge_styles` for the examples.

Parameters**fallback** (*Style*) – Style to merge the attributes with.**Returns**

self

Return type*Style***merge_overwrite**(*overwrite*)Merge current style with specified *overwrite style*, following the rules:

1. *overwrite* attribute value is in priority, i.e. when both *self* and *overwrite* attributes are defined, replace *self* value with *overwrite* one (in contrast to *merge_fallback()*, which works the opposite way).
2. If *self* attribute is *None*, take the value from *overwrite*'s corresponding attribute, and vice versa.
3. If both attribute values are *None*, keep the *None*.

All attributes corresponding to constructor arguments except *fallback* are subject to merging. *NOOP_COLOR* is treated like *None* (default for fg and bg).

Modifies the instance in-place and returns it as well (for chained calls).

Listing 2: Merging different values in overwrite mode

	BASE(SELF)	OVERWRITE	RESULT	
	+-----+	+-----+	+-----+	
ATTR-1	True ==∅	False --->	False	OVERWRITE val is in priority
ATTR-2	None	True --->	True	OVERWRITE val is in priority
ATTR-3	True ===	None ==>	True	no OVERWRITE val, keeping BASE val
ATTR-4	None	None	None	no vals, keeping unset
	+-----+	+-----+	+-----+	

See also:

merge_styles for the examples.

Parameters**overwrite** (*Style*) – Style to merge the attributes with.**Returns**

self

```
pytermor.style.NOOP_STYLE = <NoOpStyle[NOP]>
```

Special style passing the text through without any modifications.

Important: This class is immutable, i.e. *LogicError* will be raised upon an attempt to modify any of its attributes, which can lead to schrödinbugs:

```
st1.merge_fallback(Style(bold=True), [Style(italic=False)])
```

If *st1* is a regular style instance, the statement above will always work (and pass the tests), but if it happens to be a *NOOP_STYLE*, this will result in an exception. To protect from this outcome one could merge styles via frontend method *merge_styles* only, which always makes a copy of base argument and thus cannot lead to such behaviour.

class pytermor.style.Styles

Some ready-to-use styles. Can be used as examples.

```

WARNING = <Style[yellow:NOP]>
WARNING_LABEL = <Style[yellow:NOP +BOLD]>
WARNING_ACCENT = <Style[hi-yellow:NOP]>
ERROR = <Style[red:NOP]>
ERROR_LABEL = <Style[red:NOP +BOLD]>
ERROR_ACCENT = <Style[hi-red:NOP]>
CRITICAL = <Style[hi-white:X160[D70000]]>
CRITICAL_LABEL = <Style[hi-white:X160[D70000] +BOLD]>
CRITICAL_ACCENT = <Style[hi-white:X160[D70000] +BOLD +BLINK]>

```

`pytermor.style.make_style(fmt=None)`

General *Style* constructor. Accepts a variety of argument types:

- *CDT* (*str* or *int*)
This argument type implies the creation of basic *Style* with the only attribute set being *fg* (i.e., text color). For the details on color resolving see *resolve_color()*.
- *Style*
Existing style instance. Return it as is.
- *None*
Return *NOOP_STYLE*.

Parameters

fmt (*FT*) – See *FT*.

Return type

Style

`pytermor.style.merge_styles(base=<_NoOpStyle[NOP]>, *, fallbacks=(), overwrites=())`

Bulk style merging method. First merge fallbacks *styles* with the base in the same order they are iterated, using *merge_fallback()* algorithm; then do the same for overwrites styles, but using *merge_overwrite()* merge method.

The original *base* is left untouched, as all the operations are performed on its clone.

Listing 3: Dual mode merge diagram

The key actions are marked with (A) to (E) letters. In reality the algorithm works in slightly different order, but the exact scheme would be less illustrative.

(A),(B)

Iterate *fallback* styles one by one; discard all the attributes of a current *fallback* style, that are already set in *base* style (i.e., that are not *Nones*). Update all *base* style empty attributes

with corresponding fallback values, if they exist and are not empty. Repeat these steps for the next fallback in the list, until the list is empty.

Listing 4: Fallback merge algorithm example №1

```
>>> base = Style(fg='red')
>>> fallbacks = [Style(fg='blue'), Style(bold=True),
↳ Style(bold=False)]
>>> merge_styles(base, fallbacks=fallbacks)
<Style[red:NOP +BOLD]>
```

In the example above:

- the first fallback will be ignored, as fg is already set;
- the second fallback will be applied (base style will now have bold set to *True*;
- which will make the handler ignore third fallback completely; if third fallback was encountered earlier than the 2nd one, base bold attribute would have been set to *False*, but alas.

Note: Fallbacks allow to build complex style conditions, e.g. take a look into [Highlighter.colorize\(\)](#) method

```
int_st = merge_styles(st, fallbacks=[Style(bold=True)])
```

Instead of using `Style(st, bold=True)` the merging algorithm is invoked. This changes the logic of “bold” attribute application – if there is a necessity to explicitly forbid bold text at base/parent level, one could write:

```
STYLE_NUL = Style(STYLE_DEFAULT, cv.GRAY, bold=False)
STYLE_PRC = Style(STYLE_DEFAULT, cv.MAGENTA)
STYLE_KIL = Style(STYLE_DEFAULT, cv.BLUE)
...
```

As you can see, resulting `int_st` will be bold for all styles other than `STYLE_NUL`.

Listing 5: Fallback merge algorithm example №2

```
>>> merge_styles(Style(fg=cv.BLUE), fallbacks=[Style(bold=True)])
<Style[blue:NOP +BOLD]>
>>> merge_styles(Style(fg=cv.GRAY, bold=False),
↳ fallbacks=[Style(bold=True)])
<Style[gray:NOP -BOLD]>
```

(C),(D),(E)

Iterate `overwrite` styles one by one; discard all the attributes of a base style that have a non-empty counterpart in `overwrite` style, and put corresponding `overwrite` attribute values instead of them. Keep base attribute values that have no counterpart in current `overwrite` style (i.e., if attribute value is *None*). Then pick next `overwrite` style from the input list and repeat all these steps.

Listing 6: Overwrite merge algorithm example

```
>>> base = Style(fg='red')
>>> overwrites = [Style(fg='blue'), Style(bold=True),
↳ Style(bold=False)]
>>> merge_styles(base, overwrites=overwrites)
<Style[blue:NOP -BOLD]>
```

In the example above all the `overwrites` will be applied in order they were put into *list*, and the result attribute values are equal to the last encountered non-empty values in `overwrites` list.

Parameters

- **base** (*Style*) – Basis style instance.
- **fallbacks** (*Iterable[Style]*) – List of styles to be used as a backup attribute storage, when there is no value set for the attribute in question. Uses *merge_fallback()* merging strategy.
- **overwrites** (*Iterable[Style]*) – List of styles to be used as attribute storage force override regardless of actual *base* attribute valuse.

Returns

Clone of base style with all specified styles merged into.

Return type

Style

2.8 pytermor.text

“Front-end” module of the library. Contains classes supporting high-level operations such as nesting-aware style application, concatenating and cropping of styled strings before the rendering, text alignment and wrapping, etc.

Module Attributes

<i>RT</i>	RT (Renderable type) includes regular <i>strs</i> as well as <i>IRenderable</i> implementations.
-----------	--

Functions

<code>as_fragments(string)</code>	
<i>distribute_padded()</i>	param max_len
<i>echo</i> ([string, fmt, renderer, ...])	.
<i>echoi</i> ([string, fmt, renderer, ...])	echo inline
<i>render</i> ([string, fmt, renderer, ...])	.
<i>wrap_sgr</i> (raw_input, width[, indent_first, ...])	A workaround to make standard library <code>textwrap.wrap()</code> more friendly to an SGR-formatted strings.

Classes

<i>Fragment</i> ([string, fmt, close_this, close_prev])	<Immutable>
<i>FrozenText</i> ()	
	param align default is left
<i>IRenderable</i> ()	I
<i>SimpleTable</i> (*rows[, width, sep, border_st])	Table class with dynamic (not bound to each other) rows.
<i>TemplateEngine</i> ([custom_styles])	
<i>Text</i> ()	
<i>TextComposite</i> (*parts)	Simple class-container supporting concatenation of any <i>IRenderable</i> instances with each other without extra logic on top of it.

pytermor.text.RT

RT includes regular *strs* as well as *IRenderable* implementations.

alias of TypeVar('RT', str, IRenderable)

class pytermor.text.IRenderable

Bases: Sized, ABC

I

abstract raw()

pass

Return type

str

abstract render(*renderer=None*)

pass

Return type

property allows_width_setup: bool
    return False

```

```
class pytermor.text.SimpleTable(*rows, width=None, sep=' ', border_st=<_NoOpStyle[NOP]>)
```

Bases: [IRenderable](#)

Table class with dynamic (not bound to each other) rows. By default expands to the maximum width (terminal size).

Allows 0 or 1 dynamic-width cell in each row, while all the others should be static, i.e., be instances of [FrozenText](#).

```

>>> echo(
...     SimpleTable(
...         [
...             Text("1", width=1),
...             Text("word", width=6, align='center'),
...             Text("smol string"),
...         ],
...         [
...             Text("2", width=1),
...             Text("padded word", width=6, align='center', pad=2),
...             Text("biiiiiiiiiiiiiiiiiiiiiiig string"),
...         ],
...         width=30,
...         sep="|"
...     ), file=sys.stdout)
|1| word |smol string      |
|2| padd |biiiiiiiiiiiiiiii|

```

Create

Note: All arguments except **rows* are *kwonly*-type args.

Parameters

- **rows** (*t.Iterable[RT]*) –
- **width** (*int*) – Table width, in characters. When omitted, equals to terminal size if applicable, and to fallback value (80) otherwise.
- **sep** (*str*) –
- **border_st** (*Style*) –

raw()

pass

Return type

str

```

property allows_width_setup: bool
    return False

```

```

property has_width: bool
    return self._width is not None

```

render(*renderer=None*)

pass

set_width(*width*)

raise NotImplementedError

```
pytermor.text.render(string="", fmt=<_NoOpStyle[NOP]>, renderer=None, parse_template=False, *,
                      no_log=False)
```

Parameters

- **string** (*Union[pytermor.text.RT, Iterable[pytermor.text.RT]]*) – 2
- **fmt** (*pytermor.style.FT*) – 2
- **renderer** (*IRenderer*) – 2
- **parse_template** (*bool*) – 2
- **no_log** (*bool*) – 2

Returns

Return type

Union[str, List[str]]

```
pytermor.text.echo(string="", fmt=<_NoOpStyle[NOP]>, renderer=None, parse_template=False, *,
                   nl=True, file=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>,
                   flush=True, wrap=False, indent_first=0, indent_subseq=0)
```

Parameters

- **string** (*Union[pytermor.text.RT, Iterable[pytermor.text.RT]]*) –
- **fmt** (*pytermor.style.FT*) –
- **renderer** (*Optional[IRenderer]*) –
- **parse_template** (*bool*) –
- **nl** (*bool*) –
- **file** (*IO*) –
- **flush** (*bool*) –
- **wrap** (*bool | int*) –
- **indent_first** (*int*) –
- **indent_subseq** (*int*) –

```
pytermor.text.choi(string="", fmt=<_NoOpStyle[NOP]>, renderer=None, parse_template=False, *,
                   file=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>, flush=True)
```

echo inline

Parameters

- **string** (*Union[pytermor.text.RT, Iterable[pytermor.text.RT]]*) –
- **fmt** (*pytermor.style.FT*) –
- **renderer** (*Optional[IRenderer]*) –
- **parse_template** (*bool*) –

- **file** (*IO*) –
- **flush** (*bool*) –

Returns

`pytermor.text.distribute_padded(max_len: int, *values: str, pad_left: int = 0, pad_right: int = 0) → str`
`pytermor.text.distribute_padded(max_len: int, *values: RT, pad_left: int = 0, pad_right: int = 0) →`
Text

Parameters

- **max_len** –
- **values** –
- **pad_left** –
- **pad_right** –

Returns

`pytermor.text.wrap_sgr(raw_input, width, indent_first=0, indent_subseq=0)`

A workaround to make standard library `textwrap.wrap()` more friendly to an SGR-formatted strings.

The main idea is

Parameters

- **raw_input** (*str* | *list[str]*) –
- **width** (*int*) –
- **indent_first** (*int*) –
- **indent_subseq** (*int*) –

Return type

str

2.9 pytermor.utilmisc

A

Functions

<code>confirm([attempts, default, keymap, prompt, ...])</code>	Ensure the next action is manually confirmed by user.
<code>get_char_width(char, block)</code>	General-purpose method for getting width of a character in terminal columns.
<code>guess_char_width(c)</code>	Determine how many columns are needed to display a character in a terminal.
<code>hex_to_hsv(hex_value)</code>	Transforms <code>hex_value</code> in <i>int</i> form into named tuple consisting of three floats corresponding to hue , saturation and value channel values respectively.
<code>hex_to_rgb(hex_value)</code>	Transforms <code>hex_value</code> in <i>int</i> format into a tuple of three integers corresponding to red , blue and green channel value respectively.
<code>hsv_to_hex()</code>	Transforms HSV value in three-floats form (where $0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$) into an one-integer form.
<code>hsv_to_rgb()</code>	Transforms HSV value in three-floats form (where $0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$) into RGB three-integer form ([0; 255], [0; 255], [0; 255]).
<code>lab_to_rgb(l_s, a_s, b_s)</code>	@TODO
<code>measure_char_width(char[, clear_after])</code>	Low-level function that returns the exact character width in terminal columns.
<code>rgb_to_hex()</code>	Transforms RGB value in a three-integers form ([0; 255], [0; 255], [0; 255]) to an one-integer form.
<code>rgb_to_hsv()</code>	Transforms RGB value in a three-integers form ([0; 255], [0; 255], [0; 255]) to an HSV in three-floats form such as ($0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$).
<code>total_size(o[, handlers, verbose])</code>	Return the approximate memory footprint of an object and all of its contents.
<code>wait_key([block])</code>	Wait for a key press on the console and return it.

pytermor.utilmisc.hex_to_rgb(*hex_value*)

Transforms `hex_value` in *int* format into a tuple of three integers corresponding to **red**, **blue** and **green** channel value respectively. Values are within [0; 255] range.

```
>>> hex_to_rgb(0x80ff80)
RGB(red=128, green=255, blue=128)
```

Parameters

hex_value (*int*) – RGB integer value.

Returns

tuple with R, G, B channel values.

Return type

`Union[RGB, Tuple[int, int, int]]`

pytermor.utilmisc.rgb_to_hex(*rgb: RGB*) → int

pytermor.utilmisc.rgb_to_hex(*r: int, g: int, b: int*) → int

Transforms RGB value in a three-integers form ([0; 255], [0; 255], [0; 255]) to an one-integer form.

```
>>> hex(rgb_to_hex(0, 128, 0))
'0x80000'
>>> hex(rgb_to_hex(RGB(red=16, green=16, blue=0)))
'0x101000'
```

pytermor.utilmisc.hsv_to_rgb(*hsv: HSV*) → Union[RGB, Tuple[int, int, int]]

`pytermor.utilmisc.hsv_to_rgb(h: float, s: float, v: float) → Union[RGB, Tuple[int, int, int]]`

Transforms HSV value in three-floats form (where $0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$) into RGB three-integer form ([0; 255], [0; 255], [0; 255]).

```
>>> hsv_to_rgb(270, 2/3, 0.75)
RGB(red=128, green=64, blue=192)
>>> hsv_to_rgb(HSV(hue=120, saturation=0.5, value=0.77))
RGB(red=99, green=197, blue=99)
```

`pytermor.utilmisc.rgb_to_hsv(rgb: RGB) → Union[HSV, Tuple[float, float, float]]`

`pytermor.utilmisc.rgb_to_hsv(r: int, g: int, b: int) → Union[HSV, Tuple[float, float, float]]`

Transforms RGB value in a three-integers form ([0; 255], [0; 255], [0; 255]) to an HSV in three-floats form such as ($0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$).

```
>>> rgb_to_hsv(0, 0, 255)
HSV(hue=240.0, saturation=1.0, value=1.0)
```

Parameters

- **r** – value of red channel.
- **g** – value of green channel.
- **b** – value of blue channel.

Returns

H, S, V channel values correspondingly.

`pytermor.utilmisc.hex_to_hsv(hex_value)`

Transforms `hex_value` in *int* form into named tuple consisting of three floats corresponding to **hue**, **saturation** and **value** channel values respectively. Hue is within [0, 359] range, both saturation and value are within [0; 1] range.

```
>>> hex_to_hsv(0x999999)
HSV(hue=0.0, saturation=0.0, value=0.6)
```

Parameters

hex_value (*int*) – RGB value.

Returns

named tuple with H, S and V channel values

Return type

`Union[HSV, Tuple[float, float, float]]`

`pytermor.utilmisc.hsv_to_hex(hsv: HSV) → int`

`pytermor.utilmisc.hsv_to_hex(h: float, s: float, v: float) → int`

Transforms HSV value in three-floats form (where $0 \leq h < 360$, $0 \leq s \leq 1$, and $0 \leq v \leq 1$) into an one-integer form.

```
>>> hex(hsv_to_hex(90, 0.5, 0.5))
'0x608040'
```

Parameters

- **h** – hue channel value.
- **s** – saturation channel value.
- **v** – value channel value.

Returns

RGB value.

```
pytermor.utilmisc.lab_to_rgb(l_s, a_s, b_s)
```

@TODO

Parameters

- **l_s** (*float*) –
- **a_s** (*float*) –
- **b_s** (*float*) –

Returns**Return type**

Union[**RGB**, *Tuple*[int, int, int]]

```
pytermor.utilmisc.wait_key(block=True)
```

Wait for a key press on the console and return it.

Parameters

block (*bool*) – Determines setup of O_NONBLOCK flag.

Return type

Optional[AnyStr]

```
pytermor.utilmisc.confirm(attempts=1, default=False, keymap=None, prompt=None, quiet=False,
                           required=False)
```

Ensure the next action is manually confirmed by user. Print the terminal prompt with **prompt** text and wait for a keypress. Return *True* if user pressed Y and *False* in all the other cases (by default).

Valid keys are Y and N (case insensitive), while all the other keys and combinations are considered invalid, and will trigger the return of the **default** value, which is *False* if not set otherwise. In other words, by default the user is expected to press either Y or N, and if that's not the case, the confirmation request will be automatically failed.

Ctrl+C instantly aborts the confirmation process regardless of attempts count and raises *UserAbort*.

Example keymap (default one):

```
keymap = {"y": True, "n": False}
```

Parameters

- **attempts** (*int*) – Set how many times the user is allowed to perform the input before auto-cancellation (or auto-confirmation) will occur. 1 means there will be only one attempt, the first one. When set to -1, allows to repeat the input infinitely.
- **default** (*bool*) – Default value that will be returned when user presses invalid key (e.g. Backspace, Ctrl+Q etc.) and his **attempts** counter decreases to 0. Setting this to *True* effectively means that the user's only way to deny the request is to press N or Ctrl+C, while all the other keys are treated as Y.
- **keymap** (*Optional*[*Mapping*[*str*, *bool*]]) – Key to result mapping.
- **prompt** (*Optional*[*str*]) – String to display before each input attempt. Default is: "Press Y to continue, N to cancel, Ctrl+C to abort: "
- **quiet** (*bool*) – If set to *True*, suppress all messages to stdout and work silently.
- **required** (*bool*) – If set to *True*, raise *UserCancel* or *UserAbort* when user rejects to confirm current action. If set to *False*, do not raise any exceptions, just return *False*.

Raises

- *UserAbort* – On corresponding event, if **required** is *True*.

- **UserCancel** – On corresponding event, if `required` is `True`.

Returns

`True` if there was a confirmation by user's input or automatically, `False` otherwise.

Return type

`bool`

`pytermor.utilmisc.get_char_width(char, block)`

General-purpose method for getting width of a character in terminal columns.

Uses `guess_char_width()` method based on `unicodedata` package, or/and QCP-RCP ANSI control sequence communication protocol.

Parameters

- **char** (`str`) – Input char.
- **block** (`bool`) – Set to `True` if you prefer slow, but 100% accurate *measuring* (which **blocks** and requires an output tty), or `False` for a device-independent, deterministic and non-blocking *guessing*, which works most of the time, although there could be rare cases when it is not precise enough.

Return type

`int`

`pytermor.utilmisc.measure_char_width(char, clear_after=True)`

Low-level function that returns the exact character width in terminal columns.

The main idea is to reset a cursor position to 1st column, print the required character and *QCP* control sequence; after that wait for the response and *parse* it. Normally it contains the cursor coordinates, which can tell the exact width of a character in question.

After reading the response clear it from the screen and reset the cursor to column 1 again.

Important: The `stdout` must be a tty. If it is not, consider using `guess_char_width()` instead, or `IOError` will be raised.

Warning: Invoking this method produces a bit of garbage in the output stream, which looks like this: `[3;2R`. By default, it is hidden using screen line clearing (see `clear_after`).

Warning: Invoking this method may **block** infinitely. Consider using a thread or set a timeout for the main thread using a signal if that is unwanted.

Parameters

- **char** (`str`) – Input char.
- **clear_after** (`bool`) – Send *EL* control sequence after the terminal response to hide excessive utility information from the output if set to `True`, or leave it be otherwise.

Raises

IOError – If `stdout` is not a terminal emulator.

Return type

`int`

`pytermor.utilmisc.guess_char_width(c)`

Determine how many columns are needed to display a character in a terminal.

Returns -1 if the character is not printable. Returns 0, 1 or 2 for other characters.

Utilizes unicodedata table. A terminal emulator is unnecessary.

Parameters

c (*str*) –

Return type

int

`pytermor.utilmisc.total_size(o, handlers=None, verbose=False)`

Return the approximate memory footprint of an object and all of its contents.

Automatically finds the contents of the following builtin containers and their subclasses: *tuple*, *list*, *deque*, *dict*, *set* and *frozenset*. To search other containers, add handlers to iterate over their contents:

```
handlers = {ContainerClass: iter, ContainerClass2: ContainerClass2.get_elements}
```

Parameters

- **o** (*Any*) –
- **handlers** (*Optional[Dict[Any, Iterator]]*) –
- **verbose** (*bool*) –

Return type

int

2.10 pytermor.utilnum

utilnum

Module Attributes

`PREFIXES_SI_DEC`

Prefix preset used by `format_si()` and `format_bytes_human()`.

Functions

<code>format_auto_float(val, req_len[, al- low_exp_form])</code>	Dynamically adjust decimal digit amount and format to fill up the output string with as many significant digits as possible, and keep the output length strictly equal to <code>req_len</code> at the same time.
<code>format_bytes_human(val[, auto_color])</code>	Invoke special case of fixed-length SI formatter optimized for processing byte-based values.
<code>format_si(val[, unit, auto_color])</code>	Invoke fixed-length decimal SI formatter; format value as a unitless value with SI-prefixes; a unit can be provided as an argument of <code>format()</code> method.
<code>format_si_binary(val[, unit, auto_color])</code>	Invoke fixed-length binary SI formatter which formats value as binary size ("KiB", "MiB") with base 1024.
<code>format_thousand_sep(val[, separator])</code>	Returns input <code>val</code> with integer part split into groups of three digits, joined then with <code>separator</code> string.
<code>format_time(val_sec[, auto_color])</code>	Invoke dynamic-length general-purpose time formatter, which supports a wide range of output units, including seconds, minutes, hours, days, weeks, months, years, milliseconds, microseconds, nanoseconds etc.
<code>format_time_delta(val_sec[, max_len, auto_color])</code>	Format time interval using the most suitable format with one or two time units, depending on <code>max_len</code> argument.
<code>format_time_delta_longest(val_sec[, auto_color])</code>	Wrapper around <code>format_time_delta()</code> with pre-set longest formatter.
<code>format_time_delta_shortest(val_sec[, auto_color])</code>	Wrapper around <code>format_time_delta()</code> with pre-set shortest formatter.
<code>format_time_ms(value_ms[, auto_color])</code>	Invoke a variation of <code>formatter_time</code> specifically configured to format small time intervals.
<code>format_time_ns(value_ns[, auto_color])</code>	Wrapper for <code>format_time_ms()</code> expecting input value as nanoseconds.
<code>highlight(string)</code>	

Classes

<code>BaseUnit(oom[, unit, prefix, _integer])</code>	
<code>DualBaseUnit(name[, in_next, ...])</code>	TU
<code>DualFormatter([fallback, units, auto_color, ...])</code>	Formatter designed for time intervals.
<code>DualFormatterRegistry()</code>	Simple <code>DualFormatter</code> registry for storing formatters and selecting the suitable one by max output length.
<code>DynamicFormatter([fallback, units, ...])</code>	A simplified version of static formatter for cases, when length of the result string doesn't matter too much (e.g., for log output), and you don't have intention to customize the output (too much).
<code>Highlighter([dim_units])</code>	S
<code>NumFormatter(auto_color, highlighter)</code>	
<code>StaticFormatter([fallback, max_value_len, ...])</code>	Format value using settings passed to constructor.
<code>SupportsFallback()</code>	

```
pytermor.utilnum.PREFIXES_SI_DEC = ['q', 'r', 'y', 'z', 'a', 'f', 'p', 'n', 'μ', 'm',  
None, 'k', 'M', 'G', 'T', 'P', 'E', 'Z', 'Y', 'R', 'Q']
```

Prefix preset used by `format_si()` and `format_bytes_human()`. Covers values from 10^{-30} to 10^{32} . Note lower-cased ‘k’ prefix.

```
class pytermor.utilnum.Highlighter(dim_units=True)
```

S

colorize(*string*)

parse and highlight

Parameters

string (*str*) –

Returns

Return type

Text

apply(*intp, frac, sep, pfx, unit*)

highlight already parsed

Parameters

- **intp** (*str*) –
- **frac** (*str*) –
- **sep** (*str*) –
- **pfx** (*str*) –
- **unit** (*str*) –

Returns

Return type

List[Fragment]

```
class pytermor.utilnum.StaticFormatter(fallback=None, *, max_value_len=None, auto_color=None,
allow_negative=None, allow_fractional=None,
discrete_input=None, unit=None, unit_separator=None,
mcoef=None, pad=None, legacy_rounding=None,
prefixes=None, prefix_refpoint_shift=None,
value_mapping=None, highlighter=None)
```

Bases: NumFormatter

Format value using settings passed to constructor. The purpose of this class is to fit into specified string length as much significant digits as it’s theoretically possible by using multipliers and unit prefixes. Designed for metric systems with bases 1000 or 1024.

The key property of this formatter is maximum length – the output will not excess specified amount of characters no matter what (that’s what is “static” for).

You can create your own formatters if you need fine tuning of the output and customization. If that’s not the case, there are facade methods `format_si()`, `format_si_binary()` and `format_bytes_human()`, which will invoke predefined formatters and doesn’t require setting up.

Note: All arguments except `fallback` are *kwonly*-type arguments.

Parameters

- **fallback** (`StaticFormatter`) – Take missing (i.e., *None*) attribute values from this instance.

- **max_value_len** (*int*) – [default: 4] Target string length. Must be at least **3**, because it's a minimum requirement for formatting values from 0 to 999. Next number to 999 is 1000, which will be formatted as “1k”.

Setting `allow_negative` to *True* increases lower bound to **4** because the values now can be less than 0, and minus sign also occupies one char in the output.

Setting `mcoef` to anything other than 1000.0 also increases the minimum by 1, to **5**. The reason is that non-decimal coefficients like 1024 require additional char to render as switching to the next prefix happens later: “999 b”, “1000 b”, “1001 b”, ... “1023 b”, “1 Kb”.

- **auto_color** (*bool*) – [default: *False*] Enable automatic colorizing of the result. Color depends on order of magnitude of the value, and always the same, e.g.: blue color for numbers in $[1000; 10^6)$ and $[10^{-3}; 1)$ ranges (prefixes nearest to 1, kilo- and milli-); cyan for values in $[10^6; 10^9)$ and $[10^{-6}; 10^{-3})$ ranges (next ones, mega-/micro-), etc. The values from $[1; 999]$ are colored in neutral gray. See [Highlighter](#).
- **allow_negative** (*bool*) – [default: *True*] Allow negative numbers handling, or (if set to *False*) ignore the sign and round all of them to 0.0. This option effectively increases lower limit of `max_value_len` by 1 (when enabled).
- **allow_fractional** (*bool*) – [default: *True*] Allows the usage of fractional values in the output. If set to *False*, the results will be rounded. Does not affect lower limit of `max_value_len`.
- **discrete_input** (*bool*) – [default: *False*] If set to *True*, truncate the fractional part off the input and do not use floating-point format for *base output*, i.e., without prefix and multiplying coefficient. Useful when the values are originally discrete (e.g., bytes). Note that the same effect could be achieved by setting `allow_fractional` to *False*, except that it will influence prefixed output as well (“1.08 kB” -> “1kB”).
- **unit** (*str*) – [default: empty *str*] Unit to apply prefix to (e.g., “m”, “B”). Can be empty.
- **unit_separator** (*str*) – [default: a space] String to place in between the value and the (prefixed) unit. Can be empty.
- **mcoef** (*float*) – [default: 1000.0] Multiplying coefficient applied to the value:

$$V_{out} = V_{in} * b^{(-m/3)},$$

where: V_{in} is an input value, V_{out} is a numeric part of the output, b is `mcoef` (base), and m is the order of magnitude corresponding to a selected unit prefix. For example, in case of default (decimal) formatter and input value equal to 17345989 the selected prefix will be “M” with the order of magnitude = 6:

$$V_{out} = 17345989 * 1000^{(-6/3)} = 17345989 * 10^{-6} = 17.346.$$

- **pad** (*bool*) – [default: *False*]
- **legacy_rounding** (*bool*) – [default: *False*]
- **prefixes** (*list[str|None]*) – [default: `PREFIXES_SI_DEC`] Prefix list from min power to max. Reference point (with zero-power multiplier, or 1.0) is determined by searching for *None* in the list provided, therefore it's a requirement for the argument to have at least one *None* value. Prefix list for a formatter without fractional values support could look like this:

[None, "k", "M", "G", "T"]

Prefix step is fixed to $\log_{10}1000 = 3$, as specified for metric prefixes.

- **prefix_refpoint_shift** (*int*) – [default: 0] Should be set to a non-zero number if input represents already prefixed value; e.g. to correctly format a variable, which stores

the frequency in MHz, set prefix shift to 2; the formatter then will render 2333 as “2.33 GHz” instead of incorrect “2.33 kHz”.

- **value_mapping** (*t.Dict[float, RT] | t.Callable[[float], RT]*) –
@TODO
- **highlighter** (*Highlighter*) – ...

get_max_len(*unit=None*)

Parameters

unit (*Optional[str]*) – Unit override. Set to *None* to use formatter default.

Returns

Maximum length of the result. Note that constructor argument is `max_value_len`, which is a different parameter.

Return type

int

format(*val, unit=None, auto_color=None*)

Parameters

- **val** (*float*) – Input value.
- **unit** (*Optional[str]*) – Unit override. Set to *None* to use formatter default.
- **auto_color** (*Optional[bool]*) – Color mode, *bool* to enable/disable auto-colorizing, *None* to use formatter default value.

Returns

Formatted value, *Text* if colorizing is on, *str* otherwise.

Return type

pytermor.text.RT

```
class pytermor.utilnum.DynamicFormatter(fallback=None, units=None, *, auto_color=None,  
allow_fractional=None, unit_separator=None,  
oom_shift=None, highlighter=None)
```

Bases: NumFormatter

A simplified version of static formatter for cases, when length of the result string doesn't matter too much (e.g., for log output), and you don't have intention to customize the output (too much).

Note: All arguments except `fallback` and `units` are *kwonly*-type arguments.

```
format(val, auto_color=False, oom_shift=None)
```

```
..., :param val: :param oom_shift: :param auto_color: :return:
```

Return type

pytermor.text.RT

```
class pytermor.utilnum.BaseUnit(oom: 'float', unit: 'str' = '', prefix: 'str' = '', _integer: 'bool' = None)
```

```
class pytermor.utilnum.DualFormatter(fallback=None, units=None, *, auto_color=None,  
allow_negative=None, allow_fractional=None,  
unit_separator=None, pad=None, plural_suffix=None,  
overflow_msg=None, highlighter=None)
```

Bases: NumFormatter

Formatter designed for time intervals. Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”, etc.

It is possible to create custom formatters if fine tuning of the output and customization is necessary; otherwise use a facade method `format_time_delta()`, which selects appropriate formatter by specified max length from a preset list.

Example output:

```
"10 secs", "5 mins", "4h 15min", "5d 22h"
```

Parameters

- **fallback** (`DualFormatter`) –
- **units** (`t.List[DualBaseUnit]`) –
- **auto_color** (`bool`) – If *True*, the result will be colorized depending on unit type.
- **allow_negative** (`bool`) –
- **allow_fractional** (`bool`) –
- **unit_separator** (`str`) –
- **pad** (`bool`) – Set to *True* to pad the value with spaces on the left side and ensure it’s length is equal to `max_len`, or to *False* to allow shorter result strings.
- **plural_suffix** (`str`) –
- **overflow_msg** (`str`) –
- **highlighter** (`Highlighter`) –

property max_len: `int`

This property cannot be set manually, it is computed on initialization automatically.

Returns

Maximum possible output string length.

format(`val_sec`, `auto_color=None`)

Pretty-print difference between two moments in time. If input value is too big for the current formatter to handle, return “OVERFLOW” string (or a part of it, depending on `max_len`).

Parameters

- **val_sec** (`float`) – Input value in seconds.
- **auto_color** (`Optional[bool]`) – Color mode, *bool* to enable/disable colorizing, *None* to use formatter default value.

Returns

Formatted time delta, *Text* if colorizing is on, *str* otherwise.

Return type

`pytermor.text.RT`

format_base(`val_sec`, `auto_color=None`)

Pretty-print difference between two moments in time. If input value is too big for the current formatter to handle, return *None*.

Parameters

- **val_sec** (`float`) – Input value in seconds.

- **auto_color** (*bool*) – Color mode, *bool* to enable/disable colorizing, *None* to use formatter default value.

Returns

Formatted value as *Text* if colorizing is on; as *str* otherwise. Returns *None* on overflow.

Return type

RT | None

```
class pytermor.utilnum.DualBaseUnit(name, in_next=None, overflow_after=None, custom_short=None,
                                     collapsible_after=None)
```

TU

Important: `in_next` and `overflow_after` are mutually exclusive, and either of them is required.

Parameters

- **name** (*str*) – A unit name to display.
- **in_next** (*int*) – The base – how many current units the next (single) unit contains, e.g., for an hour in context of days:

```
CustomBaseUnit("hour", 24)
```

- **overflow_after** (*int*) – Value upper limit.
- **custom_short** (*str*) – Use specified short form instead of first letter of `name` when operating in double-value mode.
- **collapsible_after** (*int*) – Min threshold for double output to become a regular one.

```
class pytermor.utilnum.DualFormatterRegistry
```

Simple DualFormatter registry for storing formatters and selecting the suitable one by max output length.

```
register(*formatters)
```

...

```
find_matching(max_len)
```

...

Return type

pytermor.utilnum.DualFormatter | None

```
get_by_max_len(max_len)
```

...

Return type

pytermor.utilnum.DualFormatter | None

```
get_shortest()
```

...

Return type

pytermor.utilnum.DualFormatter | None

```
get_longest()
```

...

Return type

pytermor.utilnum.DualFormatter | None

`pytermor.utilnum.highlight(string)`

Todo: @TODO

Max output len

same as input

Parameters

string (*str*) – input text

Return type

pytermor.text.RT

`pytermor.utilnum.format_thousand_sep(val, separator='')`

Returns input *val* with integer part split into groups of three digits, joined then with *separator* string.

```
>>> format_thousand_sep(260341)
'260 341'
>>> format_thousand_sep(-9123123123.55, ',')
'-9,123,123,123.55'
```

Max output len

$(L + \max(0, \text{floor}(M/3)))$,

where *L* is *val* length, and *M* is order of magnitude of *val*

Parameters

- **val** (*int* | *float*) – value to format
- **separator** (*str*) – character(s) to use as thousand separators

Return type

str

`pytermor.utilnum.format_auto_float(val, req_len, allow_exp_form=True)`

Dynamically adjust decimal digit amount and format to fill up the output string with as many significant digits as possible, and keep the output length strictly equal to *req_len* at the same time.

For values impossible to fit into a string of required length and when rounding doesn't help (e.g. 12 500 000 and 5 chars) algorithm switches to scientific notation, and the result looks like '1.2e7'. If this feature is explicitly disabled with *allow_exp_form = False*, then:

- 1) if absolute value is less than 1, zeros will be returned ('0.0000');
- 2) if value is a big number (like 10^9), *ValueError* will be raised instead.

```
>>> format_auto_float(0.012345678, 5)
'0.012'
>>> format_auto_float(0.123456789, 5)
'0.123'
>>> format_auto_float(1.234567891, 5)
'1.235'
>>> format_auto_float(12.34567891, 5)
'12.35'
>>> format_auto_float(123.4567891, 5)
'123.5'
>>> format_auto_float(1234.567891, 5)
'1235'
```

(continues on next page)

(continued from previous page)

```
>>> format_auto_float(12345.67891, 5)
'12346'
```

Max output len*adjustable***Parameters**

- **val** (*float*) – Value to format.
- **req_len** (*int*) – Required output string length.
- **allow_exp_form** (*bool*) – Allow scientific notation usage when that's the only way of fitting the value into a string of required length.

Raises**ValueError** – When value is too long and `allow_exp_form` is *False*.**Return type***str*

`pytermor.utilnum.format_si(val, unit=None, auto_color=None)`

Invoke fixed-length decimal SI formatter; format *value* as a unitless value with SI-prefixes; a unit can be provided as an argument of `format()` method. Suitable for formatting any SI unit with values from 10^{-30} to 10^{32} .

Total maximum length is `max_value_len` + 2, which is **6** by default (4 from value + 1 from separator and + 1 from prefix). If the unit is defined and is a non-empty string, the maximum output length increases by length of that unit.

Listing 7: Extending the formatter

```
my_formatter = StaticFormatter(formatter_si)
```

```
>>> format_si(1010, 'm²')
'1.01 km²'
>>> format_si(0.223, 'g')
'223 mg'
>>> format_si(1213531546, 'W') # great scott
'1.21 GW'
>>> format_si(1.22e28, 'eV') # the Planck energy
'12.2 ReV'
```

Max output len**6****Parameters**

- **val** (*float*) – Input value (unitless).
- **unit** (*Optional[str]*) – A unit override [default unit is an empty string].
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable colorizing depending on unit type, *None* to use formatters' setting value [*False* by default].

ReturnsFormatted value, *Text* if colorizing is on, *str* otherwise.**Return type**`pytermor.text.RT`

`pytermor.utilnum.format_si_binary(val, unit=None, auto_color=False)`

Invoke fixed-length binary SI formatter which formats `value` as binary size (“KiB”, “MiB”) with base 1024. Unit can be customized. Covers values from 0 to 10^{32} .

While being similar to `formatter_si`, this formatter differs in one aspect. Given a variable with default value = 995, formatting it results in “995 B”. After increasing it by 20 it equals to 1015, which is still not enough to become a kilobyte – so returned value will be “1015 B”. Only after one more increase (at 1024 and more) the value will morph into “1.00 KiB” form.

That’s why the initial `max_value_len` should be at least 5 – because it is a minimum requirement for formatting values from 1023 to -1023. However, The negative values for this formatter are disabled by default and rendered as 0, which decreases the `max_value_len` minimum value back to 4.

Total maximum length of the result is `max_value_len + 4 = 8` (base + 1 from separator + 1 from unit + 2 from prefix, assuming all of them have default values defined in `formatter_si_binary`).

Listing 8: Extending the formatter

```
my_formatter = StaticFormatter(formatter_si_binary)
```

```
>>> format_si_binary(1010) # 1010 b < 1 kb
'1010 B'
>>> format_si_binary(1080)
'1.05 KiB'
>>> format_si_binary(45200)
'44.1 KiB'
>>> format_si_binary(1.258 * pow(10, 6), 'b')
'1.20 Mib'
```

Max output len

8

Parameters

- **val** (*float*) – Input value in bytes.
- **unit** (*Optional[str]*) – A unit override [default unit is “B”].
- **auto_color** (*bool*) – Color mode override, *bool* to enable/disable colorizing depending on unit type, *None* to use formatters’ setting value [*False* by default].

Returns

Formatted value, *Text* if colorizing is on, *str* otherwise.

Return type

`pytermor.text.RT`

`pytermor.utilnum.format_bytes_human(val, auto_color=False)`

Invoke special case of fixed-length SI formatter optimized for processing byte-based values. Inspired by default stats formatting used in [htop](#)¹⁰. Comprises traits of both preset SI formatters, the key ones being:

- expecting integer inputs;
- prohibiting negative inputs;
- operating in decimal mode with the base of 1000 (not 1024);
- the absence of units and value-unit separators in the output, while prefixes are still present;
- (if colors allowed) utilizing [Highlighter](#) with a bit customized setup, as detailed below.

Total maximum length is `max_value_len + 1`, which is **5** by default (4 from value + 1 from prefix).

Highlighting options

Default highlighter for this formatter does not render units (as well as prefixes) dimmed. The main reason for that is the absence of actual unit in the output of this formatter, while prefixes are still there; this allows to format the fractional output this way: 1.57k, where underline indicates brighter colors.

This format is acceptable because only essential info gets highlighted; however, in case of other formatters with actual units in the output this approach leads to complex and mixed-up formatting; furthermore, it doesn't matter if the highlighting affects the prefix part only or both prefix and unit parts – in either case it's just too much formatting on a unit of surface: 1.53 KiB (looks patchworky).

Table 1: Default formatters comparison

Value	SI(unit='B')	SI_BINARY	BYTES_HUMAN
1568	'1.57 kB'	'1.53 KiB'	'1.57k'
218371331	'218 MB'	'208 MiB'	'218M'
0.25	'250 mB' ¹	'0 B'	'0'
-1218371331232	'-1.2 TB'	'0 B'	'0'

Listing 9: Extending the formatter

```
my_formatter = StaticFormatter(formatter_bytes_human, unit_separator=" ")
```

```
>>> format_bytes_human(990)
'990'
>>> format_bytes_human(1010)
'1.01k'
>>> format_bytes_human(45200)
'45.2k'
>>> format_bytes_human(1.258 * pow(10, 6))
'1.26M'
```

Max output len

5

Parameters

- **val** (*int*) – Input value in bytes.
- **auto_color** (*bool*) – Color mode override, *bool* to enable/disable colorizing depending on unit type, *None* to use formatters' setting value [*False* by default].

Returns

Formatted value, *Text* if colorizing is on, *str* otherwise.

Return type

pytermor.text.RT

pytermor.utilnum.**format_time**(*val_sec*, *auto_color=None*)

Invoke dynamic-length general-purpose time formatter, which supports a wide range of output units, including seconds, minutes, hours, days, weeks, months, years, milliseconds, microseconds, nanoseconds etc.

Listing 10: Extending the formatter

```
my_formatter = DynamicFormatter(formatter_time, unit_separator=" ")
```

```
>>> format_time(12)
'12.0 s'
```

(continues on next page)

¹⁰ <https://htop.dev/>

¹ 250 millibytes is not something you would see every day

(continued from previous page)

```
>>> format_time(65536)
'18 h'
>>> format_time(0.00324)
'3.2 ms'
```

Max output len*varying***Parameters**

- **val_sec** (*float*) – Input value in seconds.
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters' setting value [*False* by default].

Return type

pytermor.text.RT

pytermor.utilnum.**format_time_ms**(*value_ms*, *auto_color=None*)

Invoke a variation of `formatter_time` specifically configured to format small time intervals.

Listing 11: Extending the formatter

```
my_formatter = DynamicFormatter(formatter_time_ms, unit_separator=" ")
```

```
>>> format_time_ms(1)
'1ms'
>>> format_time_ms(344)
'344ms'
>>> format_time_ms(0.967)
'967μs'
```

Parameters

- **value_ms** (*float*) – Input value in milliseconds.
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters' setting value [*False* by default].

Returns**Return type**

pytermor.text.RT

pytermor.utilnum.**format_time_ns**(*value_ns*, *auto_color=None*)

Wrapper for `format_time_ms()` expecting input value as nanoseconds.

```
>>> format_time_ns(1003000)
'1ms'
>>> format_time_ns(3232332224)
'3s'
>>> format_time_ns(9932248284343.32)
'2h'
```

Parameters

- **value_ns** (*float*) – Input value in nanoseconds.
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters' setting value [*False* by default].

Returns**Return type**

pytermor.text.RT

pytermor.utilnum.**format_time_delta**(*val_sec*, *max_len*=None, *auto_color*=None)

Format time interval using the most suitable format with one or two time units, depending on *max_len* argument. Key feature of this formatter is an ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”, and on top of that – fixed-length output.

There are predefined formatters with output lengths of **3**, **4**, **5**, **6** and **10** characters. Therefore, you can pass in any value from 3 inclusive and it’s guaranteed that result’s length will be less or equal to required length. If *max_len* is omitted, longest registered formatter will be used.

Note: Negative values are supported by formatters 5 and 10 only.

```
>>> format_time_delta(10, 3)
'10s'
>>> format_time_delta(10, 6)
'10.0s'
>>> format_time_delta(15350, 4)
'4 h'
>>> format_time_delta(15350)
'4h 15min'
```

Max output len

3, 4, 5, 6, 10

Parameters

- **val_sec** (*float*) – Input value in seconds.
- **max_len** (*Optional[int]*) – Maximum output string length (total).
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters’ setting value [*False* by default].

Return type

pytermor.text.RT

pytermor.utilnum.**format_time_delta_shortest**(*val_sec*, *auto_color*=None)

Wrapper around [format_time_delta\(\)](#) with pre-set shortest formatter.

Max output len

3

Parameters

- **val_sec** (*float*) – Input value in seconds.
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters’ setting value [*False* by default].

Return type

pytermor.text.RT

pytermor.utilnum.**format_time_delta_longest**(*val_sec*, *auto_color*=None)

Wrapper around [format_time_delta\(\)](#) with pre-set longest formatter.

Max output len

10

Parameters

- **val_sec** (*float*) – Input value in seconds.
- **auto_color** (*Optional[bool]*) – Color mode override, *bool* to enable/disable coloring depending on unit type, *None* to use formatters' setting value [*False* by default].

Return type

pytermor.text.RT

2.11 pytermor.utilstr

Formatters for prettier output and utility classes to avoid writing boilerplate code when dealing with escape sequences. Also includes several Python Standard Library methods rewritten for correct work with strings containing control sequences.

Module Attributes

<i>ESCAPE_SEQ_REGEX</i>	s
<i>SGR_SEQ_REGEX</i>	s
<i>CSI_SEQ_REGEX</i>	sssss
<i>CONTROL_CHARS</i>	s
<i>WHITESPACE_CHARS</i>	s
<i>PRINTABLE_CHARS</i>	s
<i>NON_ASCII_CHARS</i>	s
<i>IT</i>	input-type
<i>OT</i>	output-type
<i>PTT</i>	pattern type
<i>RPT</i>	replacer type
<i>MPT</i>	# map

Functions

<i>apply_filters</i> (inp, *args)	Method for applying dynamic filter list to a target string/bytes.
<i>center_sgr</i> (s, width[, fillchar, actual_len])	SGR-formatting-aware implementation of <code>str.center</code> .
<i>dump</i> (data[, label, max_len_shift])	
<i>ljust_sgr</i> (s, width[, fillchar, actual_len])	SGR-formatting-aware implementation of <code>str.ljust</code> .
<i>pad</i> (n)	
<i>padv</i> (n)	
<i>rjust_sgr</i> (s, width[, fillchar, actual_len])	SGR-formatting-aware implementation of <code>str.rjust</code> .

Classes

<i>AbstractStringTracer</i> (char_per_line)	
<i>AbstractTracer</i> (char_per_line)	
<i>BytesTracer</i> ([char_per_line])	str/bytes as byte hex codes, grouped by 4
<i>CsiStringReplacer</i> ([repl])	Find all <i>CSI</i> seqs (i.e., starting with ESC <code>[]</code>) and replace with given string.
<i>EscSeqStringReplacer</i> ([repl])	
<i>IFilter</i> ()	Main idea is to provide a common interface for string filtering, that can make possible working with filters like with objects rather than with functions/lambda's.
<i>NonPrintsOmniVisualizer</i> ([override])	Input type: <i>str</i> , <i>bytes</i> .
<i>NonPrintsStringVisualizer</i> ([keep_newlines])	Input type: <i>str</i> . Replace every whitespace character with ".", except
<i>NoopFilter</i> ()	
<i>OmniDecoder</i> ()	
<i>OmniEncoder</i> ()	
<i>OmniMapper</i> ([override])	Input type: <i>str</i> , <i>bytes</i> .
<i>OmniSanitizer</i> ([repl])	Input type: <i>str</i> , <i>bytes</i> .
<i>SgrStringReplacer</i> ([repl])	Find all <i>SGR</i> seqs (e.g., ESC <code>[]1;4m</code>) and replace with given string.
<i>StringAligner</i> (align, width, *[, sgr_aware])	
<i>StringLinearizer</i> ([repl])	Filter transforms all whitespace sequences in the input string into a single space character, or into a specified string.
<i>StringMapper</i> ([override])	a
<i>StringReplacer</i> (pattern, repl)	.
<i>StringTracer</i> ([char_per_line])	str as byte hex codes (UTF-8), grouped by characters
<i>StringUcpTracer</i> ([char_per_line])	str as Unicode codepoints
<i>TracerExtra</i> (label)	
<i>WhitespaceRemover</i> ()	Special case of <i>StringLinearizer</i> .

`pytermor.utilstr.ljust_sgr(s, width, fillchar=' ', actual_len=None)`

SGR-formatting-aware implementation of `str.ljust`.

Return a left-justified string of length `width`. Padding is done using the specified fill character (default is a space).

Return type

str

`pytermor.utilstr.rjust_sgr(s, width, fillchar=' ', actual_len=None)`

SGR-formatting-aware implementation of `str.rjust`.

Return a right-justified string of length `width`. Padding is done using the specified fill character (default is a space).

Return type

str

```
pytermor.utilstr.center_sgr(s, width, fillchar=' ', actual_len=None)
```

SGR-formatting-aware implementation of `str.center`.

Return a centered string of length `width`. Padding is done using the specified fill character (default is a space).

Todo: (.) - f-

Return type

str

```
pytermor.utilstr.ESCAPE_SEQ_REGEX = re.compile('\n (?P<escape_char>\\x1b)\n
(?P<data>\n (?P<nf_class_seq>\n (?P<nf_interm>[\\x20-\\x2f]+)\n

map

alias of `Dict[int, IT]`

class `pytermor.utilstr.IFilter`

Bases: `Generic[IT, OT]`

Main idea is to provide a common interface for string filtering, that can make possible working with filters like with objects rather than with functions/lambdas.

abstract `apply(inp, extra=None)`

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (`pytermor.utilstr.IT`) – input string
- **extra** (`Optional[Any]`) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

`pytermor.utilstr.OT`

class `pytermor.utilstr.StringAligner(align, width, *, sgr_aware=True)`

Bases: `IFilter[str, str]`

Note: `sgr_aware` is *kwonly*-type arg.

Parameters

- **align** (`Align`) –
- **width** (`int`) –
- **sgr_aware** (`bool`) –

apply(*inp*, *extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (`Optional[Any]`) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

```
class pytermor.utilstr.AbstractTracer(char_per_line)
```

Bases: [IFilter](#)[[IT](#), str]

```
apply(inp, extra=None)
```

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** ([pytermor.utilstr.IT](#)) – input string
- **extra** (*Optional* [[TracerExtra](#)]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

```
class pytermor.utilstr.BytesTracer(char_per_line=32)
```

Bases: [AbstractTracer](#)[bytes]

str/bytes as byte hex codes, grouped by 4

Listing 12: Example output

0000	0A 20 32 31 36 20 20 20	E2 94 82 20 20 75 70 6C	a

apply(inp, extra=None)Apply the filter to input *str* or *bytes*.**Parameters**

- **inp** (*pytermor.utilstr.IT*) – input string
- **extra** (*Optional[TracerExtra]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

```
class pytermor.utilstr.TracerExtra(label: 'str')
```

```
class pytermor.utilstr.StringReplacer(pattern, repl)
```

Bases: [IFilter](#)[str, str]

.

```
apply(inp, extra=None)
```

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional* [*Any*]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

```
class pytermor.utilstr.SgrStringReplacer(repl="")
```

Bases: [StringReplacer](#)

Find all [SGR](#) seqs (e.g., ESC [1;4m) and replace with given string. More specific version of [CsiReplacer](#).

Parameters

repl (*RPT* [*str*]) – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).

```
apply(inp, extra=None)
```

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional* [*Any*]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

```
class pytermor.utilstr.CsiStringReplacer(repl="")
```

Bases: [StringReplacer](#)

Find all [CSI](#) seqs (i.e., starting with ESC []) and replace with given string. Less specific version of [SgrReplacer](#), as CSI consists of SGR and many other sequence subtypes.

Parameters

repl (*RPT* [*str*]) – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).

```
apply(inp, extra=None)
```

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string

- **extra** (*Optional*[*Any*]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

class pytermor.utilstr.**StringLinearizer**(*repl*=' ')

Bases: *StringReplacer*

Filter transforms all whitespace sequences in the input string into a single space character, or into a specified string. Most obvious application is pre-formatting strings for log output in order to keep the messages one-lined.

Parameters

repl (*RPT*[*str*]) – Replacement character(s).

apply(*inp*, *extra*=*None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional*[*Any*]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

class pytermor.utilstr.**WhitespaceRemover**

Bases: *StringLinearizer*

Special case of *StringLinearizer*. Removes all the whitespaces from the input string.

apply(*inp*, *extra*=*None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional*[*Any*]) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

class pytermor.utilstr.**OmniMapper**(*override*=*None*)

Bases: *IFilter*[*IT*, *IT*]

Input type: *str*, *bytes*. Abstract mapper. Replaces every character found in map keys to corresponding map value. Map should be a dictionary of this type: dict[int, str|bytes|None]; moreover, length of *str/bytes* must be strictly 1 character (ASCII codepage). If there is a necessity to map Unicode characters, *StringMapper* should be used instead.

```
>>> OmniMapper({0x20: ' '}).apply(b'abc def ghi')
b'abc.def.ghi'
```

For mass mapping it is better to subclass [OmniMapper](#) and override two methods – `_get_default_keys` and `_get_default_replacer`. In this case you don't have to manually compose a replacement map with every character you want to replace.

Parameters

override (*MPT*) – a dictionary with mappings: keys must be *ints*, values must be either a single-char *strs* or *bytes*, or *None*.

See

[NonPrintsOmniVisualizer](#)

apply(*inp*, *extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*pytermor.utilstr.IT*) – input string
- **extra** (*Optional[Any]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

pytermor.utilstr.IT

class *pytermor.utilstr.StringMapper*(*override=None*)

Bases: [OmniMapper](#)[*str*]

a

apply(*inp*, *extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional[Any]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

str

class *pytermor.utilstr.NonPrintsOmniVisualizer*(*override=None*)

Bases: [OmniMapper](#)

Input type: *str*, *bytes*. Replace every whitespace character with `..`

apply(*inp*, *extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*pytermor.utilstr.IT*) – input string
- **extra** (*Optional[Any]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

pytermor.utilstr.IT

class pytermor.utilstr.NonPrintsStringVisualizer(*keep_newlines=True*)Bases: *StringMapper*

Input type: *str*. Replace every whitespace character with “.”, except newlines. Newlines are kept and get prepended with same char by default, but this behaviour can be disabled with *keep_newlines = False*.

```
>>> NonPrintsStringVisualizer(keep_newlines=False).apply("S"+os.linesep+
↪ "K")
'SK'
>>> apply_filters('1. D'+os.linesep+'2. L ', NonPrintsStringVisualizer())
'1. L D'
```

Block quote ends without a blank line; unexpected unindent.

```
2. L'
```

param keep_newlines

When *True*, transform newline characters into “\n”, or into just “” otherwise.

apply(*inp, extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*str*) – input string
- **extra** (*Optional[Any]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type*str***class** pytermor.utilstr.OmniSanitizer(*repl=b'.'*)Bases: *OmniMapper*

Input type: *str*, *bytes*. Replace every control character and every non-ASCII character (0x80-0xFF) with “.”, or with specified char. Note that the replacement should be a single ASCII character, because *Omni*- filters are designed to work with *str* inputs and *bytes* inputs on equal terms.

Parameters

repl (*IT*) – Value to replace control/non-ascii characters with. Should be strictly 1 character long.

apply(*inp, extra=None*)

Apply the filter to input *str* or *bytes*.

Parameters

- **inp** (*pytermor.utilstr.IT*) – input string
- **extra** (*Optional[Any]*) – additional options

Returns

transformed string; the type can match the input type, as well as be different – that depends on filter type.

Return type

pytermor.utilstr.IT

pytermor.utilstr.**apply_filters**(inp, *args)

Method for applying dynamic filter list to a target string/bytes.

Example (will replace all ESC control characters to E and thus make SGR params visible):

```
>>> from pytermor import SeqIndex
>>> test_str = f'{SeqIndex.RED}test{SeqIndex.COLOR_OFF}'
>>> apply_filters(test_str, SgrStringReplacer('E\2\3\4'))
'E[31mtestE[39m'

>>> apply_filters('[31mtest[39m', OmniSanitizer)
'. [31mtest. [39m'
```

Note that type of `inp` argument must be same as filter parameterized input type (*IT*), i.e. *StringReplacer* is `IFilter[str, str]` type, so you can apply it only to *str*-type inputs.

Parameters

- **inp** (*pytermor.utilstr.IT*) – String/bytes to filter.
- **args** (`Union[IFilter, Type[IFilter]]`) – Instance(s) implementing *IFilter* or their type(s).

Return type

pytermor.utilstr.OT

pytermor.utilstr.**dump**(data, label=None, max_len_shift=None)**Todo:**

- format selection
- special handling of one-line input
- squash repeating lines

Return type

str | None

3

CHANGELOG

3.1 Releases

This project uses Semantic Versioning – <https://semver.org> (*starting from v2.0*)

3.1.1 pending

- [UPDATE] Update coverage.yml
- pdf documentation
- cleanup
- (c) update
- [FIX] flake8
- [NEW] `IRenderable.raw()` method
- [NEW] `cval` atlassian colors
- [REFACTOR] made `measure` and `trace` private
- [NEW] `utilmisc` color transform methods overloaded
- [DOCS] a lot

3.1.2 v2.48-dev

Apr 23

- [DOCS] small fixes
- [DOCS] updated changelog
- [FIX] *measure_char_width* and *get_char_width* internal logic
- [FIX] pipelines
- [FIX] *AbstractTracer* failure on empty input
- [FIX] *StaticFormatter* padding
- [FIX] bug in *SimpleTable* renderer when row is wider than a terminal
- [FIX] debug logging
- coverage git ignore
- cli-docker make command
- Dockerfile for repeatable builds
- hatch as build backend
- copyrights update
- host system/docker interchangeable building automations
- [NEW] *format_time*, *format_time_ms*, *format_time_ns*
- [NEW] Highlighter from static methods to real class
- [NEW] *lab_to_rgb()*
- [NEW] numeric formatters fallback mechanics
- [REFACTOR] TDF_REGISTRY -> dual_registry- ``FORMATTER_`` constants from top-level imports
- [REFACTOR] utilnum._TDF_REGISTRY -> TDF_REGISTRY
- [REFACTOR] edited highlighter styles
- [REFACTOR] naming:
 - CustomBaseUnit -> *DualBaseUnit*
 - DynamicBaseFormatter -> *DynamicFormatter*
 - StaticBaseFormatter -> *StaticFormatter*
- [TESTS] numeric formatters colorizing
- [UPDATE] README
- [UPDATE] license is now Lesser GPL v3

3.1.3 v2.40-dev

Feb 23

- [DOCS] changelog update
- [DOCS] *utilnum* module
- [DOCS] rethinking of references style
- [FIX] parse method of TemplateEngine
- [FIX] *Highlighter*

- [FIX] critical *Styles* color
- 2023 copytight update
- [NEW] *coveralls.io* integration
- [NEW] *echoi*, *flatten*, *flatten1* methods; *SimpleTable* class
- [NEW] *StringLinearizer*, *WhitespacRemover*
- [NEW] *text* Fragments validation
- [NEW] *Config* class
- [NEW] *hex* rst text role
- [NEW] *utilnum.format_bytes_human()*
- [NEW] add es7s C45/Kalm to rgb colors list
- [NEW] methods *percentile* and *median* ; *render_benchmark* example
- [REFACTOR] *IRenderable* rewrite
- [REFACTOR] *distribute_padded* overloads
- [REFACTOR] attempt to break cyclic dependency of *util.** modules
- [REFACTOR] moved color transformations and type vars from *_commons*
- [TESTS] additional coverage for *utilnum*

3.1.4 v2.32-dev

Jan 23

- [DOCS] *utilnum* update
- [DOCS] docstrings, typing
- [DOCS] *utilnum* module
- [FIX] *format_prefixed* and *format_auto_float* inaccuracies
- [FIX] *Text.prepend* typing
- [FIX] *TmuxRenderer* RGB output
- [NEW] *Color256* aliases “colorNN”
- [NEW] *Highlighter* from es7s, colorizing options of *utilnum* helpers
- [NEW] *IRenderable* result caching
- [NEW] *pad*, *padv* helpers
- [NEW] *prefix_refpoint_shift* argument of *PrefixedUnitFormatter*
- [NEW] *PrefixedUnitFormatter* inheritance
- [NEW] *String* and *FixedString* base renderables
- [NEW] *style.merge_styles()*
- [NEW] *Renderable* *__eq__* methods
- [NEW] *StyledString*
- [NEW] *utilmisc* *get_char_width()*, *guess_char_width()*, *measure_char_width()*
- [NEW] style merging strategies: *merge_fallback()*, *merge_overwrite*
- [NEW] subsecond delta support for *TimeDeltaFormatter*
- [TESTS] *utilnum* update

- [TESTS] integrated in-code doctests into pytest

3.1.5 v2.23-dev

- [FIX] `OmniHexPrinter` missed out newlines
- [NEW] `dump` printer caching
- [NEW] Printers and Mappers
- [NEW] `SgrRenderer` now supports non-default IO stream specifying
- [NEW] `utilstr.StringHexPrinter` and `utilstr.StringUcpPrinter`
- [NEW] add missing `hsv_to_rgb` function
- [NEW] extracted `resolve`, `approximate`, `find_closest` from `Color` class to module level, as well as color transform functions
- [NEW] split `Text` to `Text` and `FrozenText`

3.1.6 v2.18-dev

- [FIX] Disabled automatic rendering of `echo()` and `render()`.
- [NEW] `ArgCountError` migrated from `es7s/core`.
- [NEW] black code style.
- [NEW] `cval` autobuild.
- [NEW] Add `OmniHexPrinter` and `chunk()` helper.
- [NEW] Typehinting.

3.1.7 v2.14-dev

Dec 22

- [DOCS] Docs design fixes.
- [NEW] `confirm()` helper command.
- [NEW] `EscapeSequenceStringReplacer` filter.
- [NEW] `examples/terminal_benchmark` script.
- [NEW] `StringFilter` and `OmniFilter` classes.
- [NEW] Minor core improvements.
- [NEW] RGB and variations full support.
- [TESTS] Tests for `color` module.

3.1.8 v2.6-dev

Nov 22

- [NEW] `TemplateEngine` implementation.
- [NEW] `Text` nesting.
- [REFACTOR] Changes in `ConfigurableRenderer.force_styles` logic.
- [REFACTOR] Got rid of `Span` class.
- [REFACTOR] Package reorganizing.
- [REFACTOR] Rewrite of `color` module.

3.1.9 v2.2-dev

Oct 22

- [NEW] `TmuxRenderer`
- [NEW] `wait_key()` input helper.
- [NEW] Color config.
- [NEW] `IRenderable` interface.
- [NEW] Named colors list.

3.1.10 v2.1-dev

Aug 22

- [NEW] Color presets.
- [TESTS] More unit tests for formatters.

3.1.11 v2.0-dev

Jul 22

- [REWORK] Complete library rewrite.
- [DOCS] `sphinx` and `readthedocs` integraton.
- [NEW] High-level abstractions `Color`, `Renderer` and `Style`.
- [TESTS] `pytest` and `coverage` integration.
- [TESTS] Unit tests for formatters and new modules.

3.1.12 v1.8

Jun 22

- [NEW] `format_prefixed_unit` extended for working with decimal and binary metric prefixes.
- [NEW] `sequence.NOOP` SGR sequence and `span.NOOP` format.
- [NEW] `format_time_delta` extended with new settings.
- [NEW] Added 3 formatters: `format_prefixed_unit`, `format_time_delta`, `format_auto_float`.
- [NEW] Max decimal points for `auto_float` extended from (2) to (max-2).
- [REFACTOR] Utility classes reorganization.

- [REFACTOR] Value rounding transferred from `format_auto_float` to `format_prefixed_unit`.
- [TESTS] Unit tests output formatting.

3.1.13 v1.7

May 22

- [FIX] Print reset sequence as `\e[m` instead of `\e[0m`.
- [NEW] Span constructor can be called without arguments.
- [NEW] Added `span.BG_BLACK` format.
- [NEW] Added `ljust_sgr`, `rjust_sgr`, `center_sgr` util functions to align strings with SGRs correctly.
- [NEW] Added SGR code lists.

3.1.14 v1.6

- [REFACTOR] Renamed code module to `sgr` because of conflicts in PyCharm debugger (`pydevd_console_integration.py`).
- [REFACTOR] Ridded of `EmptyFormat` and `AbstractFormat` classes.
- [TESTS] Excluded tests dir from distribution package.

3.1.15 v1.5

- [REFACTOR] Removed excessive `EmptySequenceSGR` – default SGR class was specifically implemented to print out as empty string instead of `\e[m` if constructed without params.

3.1.16 v1.4

- [NEW] `Span.wrap()` now accepts any type of argument, not only `str`.
- [NEW] Added equality methods for `SequenceSGR` and `Span` classes/subclasses.
- [REFACTOR] Rebuilt Sequence inheritance tree.
- [TESTS] Added some tests for `fmt.*` and `seq.*` classes.

3.1.17 v1.3

- [NEW] Added `span.GRAY` and `span.BG_GRAY` format presets.
- [REFACTOR] Interface revisioning.

3.1.18 v1.2

- [NEW] `EmptySequenceSGR` and `EmptyFormat` classes.
- [NEW] `opening_seq` and `closing_seq` properties for `Span` class.

3.1.19 v1.1

Apr 22

- [NEW] Autoformat feature.

3.1.20 v1.0

- First public version.

3.1.21 v0.90

Mar 22

- First commit.

4

LICENSE

GNU LESSER GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <<https://fsf.org/>>
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

This version of the GNU Lesser General Public License incorporates
the terms and conditions of version 3 of the GNU General Public
License, supplemented by the additional permissions listed below.

0. Additional Definitions.

As used herein, "this License" refers to version 3 of the GNU Lesser
General Public License, and the "GNU GPL" refers to version 3 of the GNU
General Public License.

"The Library" refers to a covered work governed by this License,
other than an Application or a Combined Work as defined below.

An "Application" is any work that makes use of an interface provided
by the Library, but which is not otherwise based on the Library.
Defining a subclass of a class defined by the Library is deemed a mode
of using an interface provided by the Library.

A "Combined Work" is a work produced by combining or linking an
Application with the Library. The particular version of the Library
with which the Combined Work was made is also called the "Linked
Version".

The "Minimal Corresponding Source" for a Combined Work means the
Corresponding Source for the Combined Work, excluding any source code

(continues on next page)

(continued from previous page)

for portions of the Combined Work that, considered in isolation, are based on the Application, and not on the Linked Version.

The "Corresponding Application Code" for a Combined Work means the object code and/or source code for the Application, including any data and utility programs needed for reproducing the Combined Work from the Application, but excluding the System Libraries of the Combined Work.

1. Exception to Section 3 of the GNU GPL.

You may convey a covered work under sections 3 and 4 of this License without being bound by section 3 of the GNU GPL.

2. Conveying Modified Versions.

If you modify a copy of the Library, and, in your modifications, a facility refers to a function or data to be supplied by an Application that uses the facility (other than as an argument passed when the facility is invoked), then you may convey a copy of the modified version:

- a) under this License, provided that you make a good faith effort to ensure that, in the event an Application does not supply the function or data, the facility still operates, and performs whatever part of its purpose remains meaningful, or
- b) under the GNU GPL, with none of the additional permissions of this License applicable to that copy.

3. Object Code Incorporating Material from Library Header Files.

The object code form of an Application may incorporate material from a header file that is part of the Library. You may convey such object code under terms of your choice, provided that, if the incorporated material is not limited to numerical parameters, data structure layouts and accessors, or small macros, inline functions and templates (ten or fewer lines in length), you do both of the following:

- a) Give prominent notice with each copy of the object code that the Library is used in it and that the Library and its use are covered by this License.
- b) Accompany the object code with a copy of the GNU GPL and this license document.

4. Combined Works.

You may convey a Combined Work under terms of your choice that, taken together, effectively do not restrict modification of the portions of the Library contained in the Combined Work and reverse engineering for debugging such modifications, if you also do each of the following:

- a) Give prominent notice with each copy of the Combined Work that the Library is used in it and that the Library and its use are covered by this License.

(continues on next page)

(continued from previous page)

b) Accompany the Combined Work **with** a copy of the GNU GPL **and** this license document.

c) For a Combined Work that displays copyright notices during execution, include the copyright notice **for** the Library among these notices, **as** well **as** a reference directing the user to the copies of the GNU GPL **and** this license document.

d) Do one of the following:

0) Convey the Minimal Corresponding Source under the terms of this License, **and** the Corresponding Application Code **in** a form suitable **for**, **and** under terms that permit, the user to recombine **or** relink the Application **with** a modified version of the Linked Version to produce a modified Combined Work, **in** the manner specified by section 6 of the GNU GPL **for** conveying Corresponding Source.

1) Use a suitable shared library mechanism **for** linking **with** the Library. A suitable mechanism **is** one that (a) uses at run time a copy of the Library already present on the user's **computer** system, **and** (b) will operate properly **with** a modified version of the Library that **is** interface-compatible **with** the Linked Version.

e) Provide Installation Information, but only **if** you would otherwise be required to provide such information under section 6 of the GNU GPL, **and** only to the extent that such information **is** necessary to install **and** execute a modified version of the Combined Work produced by recombining **or** relinking the Application **with** a modified version of the Linked Version. (If you use option 4d0, the Installation Information must accompany the Minimal Corresponding Source **and** Corresponding Application Code. If you use option 4d1, you must provide the Installation Information **in** the manner specified by section 6 of the GNU GPL **for** conveying Corresponding Source.)

5. Combined Libraries.

You may place library facilities that are a work based on the Library side by side **in** a single library together **with** other library facilities that are **not** Applications **and** are **not** covered by this License, **and** convey such a combined library under terms of your choice, **if** you do both of the following:

a) Accompany the combined library **with** a copy of the same work based on the Library, uncombined **with any** other library facilities, conveyed under the terms of this License.

b) Give prominent notice **with** the combined library that part of it **is** a work based on the Library, **and** explaining where to find the accompanying uncombined form of the same work.

6. Revised Versions of the GNU Lesser General Public License.

(continues on next page)

(continued from previous page)

The Free Software Foundation may publish revised **and/or** new versions of the GNU Lesser General Public License **from** time to time. Such new versions will be similar **in** spirit to the present version, but may differ **in** detail to address new problems **or** concerns.

Each version **is** given a distinguishing version number. If the Library **as** you received it specifies that a certain numbered version of the GNU Lesser General Public License "**or any later version**" applies to it, you have the option of following the terms **and** conditions either of that published version **or** of **any** later version published by the Free Software Foundation. If the Library **as** you received it does **not** specify a version number of the GNU Lesser General Public License, you may choose **any** version of the GNU Lesser General Public License ever published by the Free Software Foundation.

If the Library **as** you received it specifies that a proxy can decide whether future versions of the GNU Lesser General Public License shall apply, that proxy's **public statement of acceptance of any version is** permanent authorization **for** you to choose that version **for** the Library.

4.1 Disclaimer of Warranty

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "**AS IS**" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

4.2 Limitation of Liability

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM, INCLUDING BUT NOT LIMITED TO LOSSES OF DATA, FAILURES OF THE PROGRAM TO OPERATE WITH OTHER PROGRAMS, OTHER LOSSES AS WELL AS ACQUISITIONS, BREAKDOWNS, REPAIRS, UNSCREWINGS, BLACKOUTS, FAINTINGS, INJURIES, BURNS, EARTHQUAKES, VOLCANIC, GEYSER AND LIMNIC ERUPTIONS, SNOW AVALANCHES, TYPHOONS, METEORITE AND SATELLITE FALLS AND OTHER NATURAL DISASTERS, AS WELL AS BEHAVIORAL DEVIATIONS OF PEOPLE, SHARKS, BIRDS AND OTHER ANIMALS, ROBBERIES, ASSAULTS, RAPES, THEFTS AND BURGLARIES, DRUNKEN BRAWLS AND RIOTS, INCESTS, ABORTIONS, SHOULDER DISLOCATIONS, MILITARY CONSCRIPTIONS, DISFELLOWSHIPPINGS, CONFINEMENTS AND EXTRADITIONS, DIVORCEMENTS, DEMOTIONS AND PROMOTIONS, EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.
