	Python Module Index	57

(yet another) Python library designed for formatting terminal output using ANSI escape codes. Implements automatic "soft" format termination. Provides a registry of low-level SGR (Select Graphic Rendition) *sequences* and formatting *spans* (or combined sequences). Also includes a set of formatters for pretty output.

Key feature of this library is providing necessary abstractions for building complex text sections with lots of formatting, while keeping the application code clear and readable.

No dependencies besides Python Standard Library are required (*there are some for testing and docs building, though*).

Todo: This is how you **should** format examples:

We put these pieces together to create a SGR command. Thus, `ESC[31m` specifies bold (or bright) text, and `ESC[31m` specifies red foreground text. We can chain together parameters; for example, `ESC[32;47m` specifies green foreground text on a white background.

The following diagram shows a complete example for rendering the word "text" in red with a single underline.

Diagram illustrating the components of an ANSI SGR command sequence: `\x1b[31;4mtext`. The sequence starts with the ESC character (hex 1b), followed by the SGR parameters `[31;4m`, and ends with the text `text`. The diagram labels the `\x1b` as the "ESC character in Hex ASCII", the `[31;4m` as "Parameters", and the `m` as the "Final Byte". A bracket labeled "CSI" (Control Sequence Initiator) spans the `\x1b[` part.

Notes

- For terminals that support bright foreground colors, `ESC[1;3Xm` is usually equivalent to `ESC[0Xm` (where `X` is a digit in 0-7). However, the reverse does not seem to hold, at least anecdotally: `ESC[2;0Xm` usually does not render the same as `ESC[3Xm`.
- Not all terminals support every effect.

Fig. 1: <https://chrisyeh96.github.io/2020/03/28/terminal-colors.html#color-schemes>

1.1 Getting started

1.1.1 Installation

```
pip install pytermor
```

1.1.2 Structure

A L	Module	Class(es)	Purpose
Hi	<i>text</i>	<i>Text</i>	Container consisting of text pieces each with attached <i>Style</i> . Renders into specified format keeping all the formatting.
		<i>Style</i> <i>Styles</i>	Reusable abstractions defining colors and text attributes (text color, bg color, <i>bold</i> attribute, <i>underlined</i> attribute etc).
		<i>SgrRenderer</i> <i>HtmlRenderer</i> <i>TmuxRenderer</i> etc.	<i>SgrRenderer</i> transforms <i>Style</i> instances into <i>Color</i> , <i>Span</i> and <i>SequenceSGR</i> instances and assembles it all up. There are several other implementations depending on what output format is required.
		<i>ColorIndexed16</i> <i>ColorIndexed256</i> <i>ColorRGB</i>	Abstractions for color operations in different color modes (default 16-color, 256-color, RGB). Tools for color approximation and transformations.
	<i>color</i>	<i>Colors</i>	Color presets (see <i>Preset list</i>).
Lo	<i>ansi</i>	<i>Span</i>	Abstraction consisting of “opening” SGR sequence defined by the developer (or taken from preset list) and complementary “closing” SGR sequence that is built automatically.
		<i>Spans</i>	Registry of predefined instances in case the developer doesn’t need dynamic output formatting and just wants to colorize an error message.
		<i>SequenceSGR</i> <i>Seqs</i>	Abstractions for manipulating ANSI control sequences and classes-factoriesm, plus a registry of preset SGRs.
		<i>IntCodes</i>	Registry of escape control sequence parameters.
	<i>util</i>	*	Additional formatters and common methods for manipulating strings with SGRs inside.

1.1.3 Features

One of the core concepts of the library is *Span* class. *Span* is a combination of two control sequences; it wraps specified string with pre-defined leading and trailing SGR definitions.

Example code:

```
1 from pytermor import Spans
2
3 print(Spans.RED('Feat') + Spans.BOLD('ures'))
```

Content-aware format nesting

Compose text spans with automatic content-aware span termination. Preset spans can safely overlap with each other (as long as they require different *breaker* sequences to reset).

```
1 from pytermor import Span
2
3 span1 = Span('blue', 'bold')
4 span2 = Span('cyan', 'inversed', 'underlined', 'italic')
5
6 msg = span1(f'Content{span2("-aware format")} nesting')
7 print(msg)
```

Flexible sequence builder

Create your own *SGR sequences* using default constructor, which accepts color/attribute keys, integer codes and even existing *SGRs*, in any amount and in any order. Key resolving is case-insensitive.

```
1 from pytermor import Seqs, SequenceSGR
2
3 seq1 = SequenceSGR('hi_blue', 1) # keys or integer codes
4 seq2 = SequenceSGR(seq1, Seqs.ITALIC) # existing SGRs
5 seq3 = SequenceSGR('underlined', 'YELLOW') # case-insensitive
6
7 msg = f'{seq1}Flexible{Seqs.RESET} ' + \
8       f'{seq2}sequence{Seqs.RESET} ' + \
9       str(seq3) + 'builder' + str(Seqs.RESET)
10 print(msg)
```

256 colors / True Color support

The library supports extended color modes:

- XTerm 256 colors indexed mode (see [Preset list](#));
- True Color RGB mode (16M colors).

```

1 from pytermor import SequenceSGR, Seqs
2
3 start_color = 41
4 for idx, c in enumerate(range(start_color, start_color+(36*6), 36)):
5     print(f'{SequenceSGR.init_color_indexed(c)}{Seqs.COLOR_OFF}', end='')
6
7 print('\n')
8 for idx, c in enumerate(range(0, 256, 256//17)):
9     r = max(0, 255-c)
10    g = max(0, min(255, 127-(c*2)))
11    b = c
12    print(f'{SequenceSGR.init_color_rgb(r, g, b)}{Seqs.COLOR_OFF}', end='')

```

Customizable output formats

Todo: @TODOTODO

String and number formatters

1.2.3 Color mode fallbacks

1.2.4 Core API

@EXAMPLES

1.3 Low-level abstractions

So, what's happening under the hood?

1.3.1 Format soft reset

There are two ways to manage color and attribute termination:

- hard reset (SGR-0 or ESC[0m)
- soft reset (SGR-22, 23, 24 etc.)

The main difference between them is that *hard* reset disables all formatting after itself, while *soft* reset disables only actually necessary attributes (i.e. used as opening sequence in *Span* instance's context) and keeps the other.

That's what *Span* class is designed for: to simplify creation of soft-resetting text spans, so that developer doesn't have to restore all previously applied formats after every closing sequence.

Example

We are given a text span which is initially *bold* and *underlined*. We want to recolor a few words inside of this span. By default this will result in losing all the formatting to the right of updated text span (because *RESET*, or ESC[0m, clears all text attributes).

However, there is an option to specify what attributes should be disabled or let the library do that for you:

```
1 from pytermor import Span, Spans, Seqs
2
3 # implicitly:
```

(continues on next page)

(continued from previous page)

```

4 span_warn = Span(93, 4)
5 # or explicitly:
6 span_warn = Span.init_explicit(
7     Seqs.HI_YELLOW + Seqs.UNDERLINED, # sequences can be summed up, remember?
8     Seqs.COLOR_OFF + Seqs.UNDERLINED_OFF, # "counteractive" sequences
9     hard_reset_after=False
10 )
11
12 orig_text = Spans.BOLD(f'this is {Seqs.BG_GRAY}the original{Seqs.RESET} string')
13 updated_text = orig_text.replace('original', span_warn('updated'), 1)
14 print(orig_text, '\n', updated_text)

```

As you can see, the update went well – we kept all the previously applied formatting. Of course, this method cannot be 100% applicable; for example, imagine that original text was colored blue. After the update “string” word won’t be blue anymore, as we used `Seqs.COLOR_OFF` escape sequence to neutralize our own yellow color. But it still can be helpful for a majority of cases (especially when text is generated and formatted by the same program and in one go).

1.3.2 Working with Spans

Use `Span` constructor to create new instance with specified control sequence(s) as a opening/starter sequence and **automatically composed** closing sequence that will terminate attributes defined in opening sequence while keeping the others (soft reset).

Resulting sequence params’ order is the same as argument’s order.

Each sequence param can be specified as:

- string key (see *Preset list*);
- integer param value;
- existing `SequenceSGR` instance (params will be extracted).

It’s also possible to avoid auto-composing mechanism and create `Span` with explicitly set parameters using `Span.init_explicit()`.

1.3.3 Creating and applying SGRs

You can use any of predefined sequences from *Seqs* registry or create your own via standard constructor. Valid argument values as well as preset constants are described in *Preset list* page.

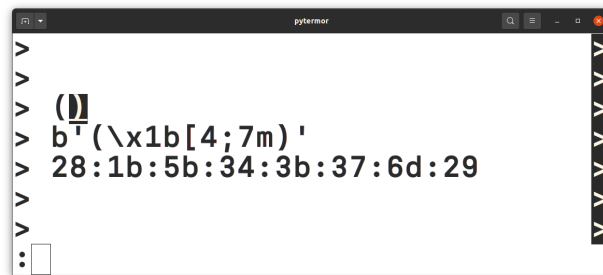

Important: SequenceSGR with zero params was specifically implemented to translate into an empty string and not into ESC[m, which would make sense, but also could be very entangling, as terminal emulators interpret that sequence as ESC[0m, which is *hard* reset sequence.

There is also a set of methods for dynamic SequenceSGR creation:

- `init_color_indexed()` will produce sequence operating in 256-colors mode (for a complete list see *Preset list*);
- `init_color_rgb()` will create a sequence capable of setting the colors in True Color 16M mode (however, some terminal emulators doesn't support it).

To get the resulting sequence chars use `assemble()` method or cast instance to `str`.

```
1 from pytermor import SequenceSGR
2
3 seq = SequenceSGR(4, 7)
4 msg = f'({seq})'
5
6 print(msg + f'{SequenceSGR(0).assemble()}')
7 print(str(msg.assemble()))
8 print(msg.assemble().hex(':'))
```

- First line is the string with encoded escape sequence;
- Second line shows up the string in raw mode, as if sequences were ignored by the terminal;
- Third line is hexademical string representation.

1.3.4 SGR sequence structure

1. ESC is escape *control character*, which opens a control sequence (can also be written as `\e` or `\x1b`).
2. `[` is sequence *introducer*; it determines the type of control sequence (in this case it's CSI (Control Sequence Introducer)).
3. 4 and 7 are *parameters* of the escape sequence; they mean “underlined” and “inversed” attributes respectively. Those parameters must be separated by `;`.
4. `m` is sequence *terminator*; it also determines the sub-type of sequence, in our case SGR. Sequences of this kind are most commonly encountered.

1.3.5 Combining SGRs

One instance of *SequenceSGR* can be added to another. This will result in a new *SequenceSGR* with combined params.

```
1 from pytermor import SequenceSGR, Seqs
2
3 combined = SequenceSGR(1, 31) + SequenceSGR(4)
4 print(f'{combined}{combined}{Seqs.RESET}', str(combined).assemble())
```

1.3.6 Core API

Todo:

- *SequenceSGR* constructor
 - *SequenceSGR.init_color_indexed()*
 - *SequenceSGR.init_color_rgb()*
 - *Span* constructor
 - *Span.init_explicit()*
-

1.4 Preset list

Preset lists are omitted from API docs to avoid unnecessary duplication; summary list of all presets defined in the library (not including *util.**) is displayed here.

Todo: USAGE - list all memthods that accept string keys of those prsets.

There are two types of color palettes used in modern terminals – first one containing 16 colors (*ColorIndexed16*), and second one consisting of 256 colors (*ColorIndexed256*). There is also True Color mode (referenced as *RGB* mode), but it is not palette-based.

Legend

- INT (intcode module -- 1st or 3rd SGR param value)
- SEQ (sequence module)
- SPN (span module)
- CLR (color module)
- STY (style module)

1.4.1 Meta, attributes, breakers

	Name	INT	SEQ	SPN	CLR	STY	Description
Meta							
	NOOP		V	V	V	V	No-operation; always assembled as empty string
	RESET	0	V				Reset all attributes and colors
Attributes							
	BOLD	1	V	V		V ¹	Bold or increased intensity
	DIM	2	V	V		V	Faint, decreased intensity
	ITALIC	3	V	V		V	Italic; <i>not widely supported</i>
	UNDERLINED	4	V	V		V	Underline
	BLINK_SLOW	5	V			V ²	Set blinking to < 150 cpm
	BLINK_FAST	6	V				Set blinking to 150+ cpm; <i>not widely supported</i>
	INVERSED	7	V	V		V	Swap foreground and background colors
	HIDDEN	8	V				Conceal characters; <i>not widely supported</i>
	CROSSLINED	9	V			V	Strikethrough
	DOUBLE_UNDERLINED	21	V				Double-underline; <i>on several terminals disables BOLD instead</i>
	COLOR_EXTENDED	38					Set foreground color [<i>indexed/RGB</i> mode]; use <i>init_color_indexed</i> and <i>init_color_rgb</i> instead
	BG_COLOR_EXTENDED	48					Set background color [<i>indexed/RGB</i> mode]; use <i>init_color_indexed</i> and <i>init_color_rgb</i> instead
	OVERLINED	53	V	V		V	Overline; <i>not widely supported</i>
Breakers							
	BOLD_DIM_OFF	22	V				Disable BOLD and DIM attributes. <i>Special aspects... It's impossible to reliably disable them on a separate basis.</i>
	ITALIC_OFF	23	V				Disable italic
	UNDERLINED_OFF	24	V				Disable underlining
	BLINK_OFF	25	V				Disable blinking
	INVERSED_OFF	27	V				Disable inverting
	HIDDEN_OFF	28	V				Disable concealing
	CROSSLINED_OFF	29	V				Disable strikethrough
	COLOR_OFF	39	V				Reset foreground color
	BG_COLOR_OFF	49	V				Reset background color
	OVERLINED_OFF	55	V				Disable overlining

¹ for this and subsequent items in “Attributes” section: as boolean flags.

² as blink.

1.4.2 Default colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
Foreground default colors								
	BLACK	30	V	V	V		#000000	Black
	RED	31	V	V	V		#800000	Maroon
	GREEN	32	V	V	V		#008000	Green
	YELLOW	33	V	V	V		#808000	Olive
	BLUE	34	V	V	V		#000080	Navy
	MAGENTA	35	V	V	V		#800080	Purple
	CYAN	36	V	V	V		#008080	Teal
	WHITE	37	V	V	V		#c0c0c0	Silver
Background default colors								
	BG_BLACK	40	V	V	V		#000000	Black
	BG_RED	41	V	V	V		#800000	Maroon
	BG_GREEN	42	V	V	V		#008000	Green
	BG_YELLOW	43	V	V	V		#808000	Olive
	BG_BLUE	44	V	V	V		#000080	Navy
	BG_MAGENTA	45	V	V	V		#800080	Purple
	BG_CYAN	46	V	V	V		#008080	Teal
	BG_WHITE	47	V	V	V		#c0c0c0	Silver
High-intensity foreground default colors								
	GRAY	90	V	V	V		#808080	Grey
	HI_RED	91	V	V	V		#ff0000	Red
	HI_GREEN	92	V	V	V		#00ff00	Lime
	HI_YELLOW	93	V	V	V		#ffff00	Yellow
	HI_BLUE	94	V	V	V		#0000ff	Blue
	HI_MAGENTA	95	V	V	V		#ff00ff	Fuchsia
	HI_CYAN	96	V	V	V		#00ffff	Aqua
	HI_WHITE	97	V	V	V		#ffffff	White
High-intensity background default colors								
	BG_GRAY	100	V	V	V		#808080	Grey
	BG_HI_RED	101	V	V	V		#ff0000	Red
	BG_HI_GREEN	102	V	V	V		#00ff00	Lime
	BG_HI_YELLOW	103	V	V	V		#ffff00	Yellow
	BG_HI_BLUE	104	V	V	V		#0000ff	Blue
	BG_HI_MAGENTA	105	V	V	V		#ff00ff	Fuchsia
	BG_HI_CYAN	106	V	V	V		#00ffff	Aqua
	BG_HI_WHITE	107	V	V	V		#ffffff	White

1.4.3 Indexed colors

	Name	INT	SEQ	SPN	CLR	STY	RGB code	XTerm name
	XTERM_BLACK ³	0			V		#000000	
	XTERM_MAROON	1			V		#800000	
	XTERM_GREEN	2			V		#008000	
	XTERM_OLIVE	3			V		#808000	
	XTERM_NAVY	4			V		#000080	
	XTERM_PURPLE_5	5			V		#800080	Purple ⁴
	XTERM_TEAL	6			V		#008080	
	XTERM_SILVER	7			V		#c0c0c0	
	XTERM_GREY	8			V		#808080	
	XTERM_RED	9			V		#ff0000	
	XTERM_LIME	10			V		#00ff00	
	XTERM_YELLOW	11			V		#ffff00	
	XTERM_BLUE	12			V		#0000ff	
	XTERM_FUCHSIA	13			V		#ff00ff	
	XTERM_AQUA	14			V		#00ffff	
	XTERM_WHITE	15			V		#ffffff	
	XTERM_GREY_0	16			V		#000000	
	XTERM_NAVY_BLUE	17			V		#00005f	
	XTERM_DARK_BLUE	18			V		#000087	
	XTERM_BLUE_3	19			V		#0000af	
	XTERM_BLUE_2	20			V		#0000d7	Blue3
	XTERM_BLUE_1	21			V		#0000ff	
	XTERM_DARK_GREEN	22			V		#005f00	
	XTERM_DEEP_SKY_BLUE_7	23			V		#005f5f	DeepSkyBlue4
	XTERM_DEEP_SKY_BLUE_6	24			V		#005f87	DeepSkyBlue4
	XTERM_DEEP_SKY_BLUE_5	25			V		#005faf	DeepSkyBlue4
	XTERM_DODGER_BLUE_3	26			V		#005fd7	
	XTERM_DODGER_BLUE_2	27			V		#005fff	
	XTERM_GREEN_5	28			V		#008700	Green4
	XTERM_SPRING_GREEN_4	29			V		#00875f	
	XTERM_TURQUOISE_4	30			V		#008787	
	XTERM_DEEP_SKY_BLUE_4	31			V		#0087af	DeepSkyBlue3
	XTERM_DEEP_SKY_BLUE_3	32			V		#0087d7	
	XTERM_DODGER_BLUE_1	33			V		#0087ff	
	XTERM_GREEN_4	34			V		#00af00	Green3
	XTERM_SPRING_GREEN_5	35			V		#00af5f	SpringGreen3
	XTERM_DARK_CYAN	36			V		#00af87	
	XTERM_LIGHT_SEA_GREEN	37			V		#00afaf	
	XTERM_DEEP_SKY_BLUE_2	38			V		#00afd7	
	XTERM_DEEP_SKY_BLUE_1	39			V		#00afff	
	XTERM_GREEN_3	40			V		#00d700	
	XTERM_SPRING_GREEN_3	41			V		#00d75f	
	XTERM_SPRING_GREEN_6	42			V		#00d787	SpringGreen2
	XTERM_CYAN_3	43			V		#00d7af	
	XTERM_DARK_TURQUOISE	44			V		#00d7d7	
	XTERM_TURQUOISE_2	45			V		#00d7ff	
	XTERM_GREEN_2	46			V		#00ff00	Green1

1.5 Color palette

Actual colors of *default* palette depend on user's terminal settings, i.e. the result color of *ColorIndexed16* is not guaranteed to exactly match the corresponding color listed below. What's more, note that *default* palette is actually a part of *indexed* one (first 16 colors of 256-color table).

Todo: (Verify) The approximation algorithm was explicitly made to ignore these colors because otherwise the results of transforming *RGB* values into *indexed* ones would be unpredictable, in addition to different results for different users, depending on their terminal emulator setup.

However, it doesn't mean that *ColorIndexed16* is useless. Just the opposite – it's ideal for situations when you don't actually **have to** set exact values and it's easier to specify estimation of desired color. I.e. setting color to 'red' is usually more than enough for displaying an error message – we don't really care of precise hue or brightness values for it.

Todo: Approximation algorithm is as simple as iterating through all colors in the *lookup table* (which contains all possible ...

³ First 16 colors are effectively the same as colors in *default* 16-color mode and share with them the same color values (and depend on terminal color scheme as well).

⁴ XTerm name list contains duplicates; variable names for these were slightly modified (different numbers at the end) to avoid namespace conflicts. Every changed name is displayed with **bold** font.

1.6 Formatters and Filters

Todo: The library contains @TODO

1.6.1 Auto-float formatter

1.6.2 Prefixed-unit formatter

1.6.3 Time delta formatter

```
1 from pytermor.text import RendererManager, SgrRenderer
2 from pytermor.util import time_delta
3
4 seconds_list = [2, 10, 60, 2700, 32340, 273600, 4752000, 864000000]
5 max_len_list = [3, 6, 10]
6
7 for max_len in max_len_list:
8     formatter = time_delta.registry.find_matching(max_len)
9
10 RendererManager.set_default(SgrRenderer)
11 for seconds in seconds_list:
12     for max_len in max_len_list:
13         formatter = time_delta.registry.get_by_max_len(max_len)
14         print(formatter.format(seconds, True), end=' ')
15 print()
```

1.6.4 String filters

1.6.5 Standard Library extensions

Todo: @TODO

API REFERENCE

2.1 ansi

Module contains definitions for low-level ANSI escape sequences handling. Documentation for *xterm* control sequences can be found here: <https://invisible-island.net/xterm/ctlseqs/ctlseqs.html>

The key difference between `Spans` and `Sequences` is that sequence can *open* text style and also *close*, or terminate it. As for `Spans` – they always do both; typical use-case of `Span` is to wrap some text in opening SGR and closing one.

Each variable in `Seqs` and `Spans` below is a valid argument for `Span` and `SequenceSGR` default constructors; furthermore, it can be passed in a string form (case-insensitive):

```
>>> Span('BG_GREEN')
Span[SGR[42], SGR[49]]
```

```
>>> Span(Seqs.BG_GREEN, Seqs.UNDERLINED)
Span[SGR[42;4], SGR[49;24]]
```

class `pytermor.ansi.Sequence`

Bases: `Sized`

Abstract ancestor of all escape sequences.

__init__(*params: `int` | `str`)

abstract assemble() → `str`

Build up actual byte sequence and return as an ASCII-encoded string.

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceFe`

Bases: `Sequence`

Wide range of sequence types that includes CSI, OSC and more.

All subtypes of this sequence start with ESC plus ASCII byte from `0x40` to `0x5F` (`@[\]^_`, and capital letters A-Z).

__init__(*params: `int` | `str`)

abstract assemble() → `str`

Build up actual byte sequence and return as an ASCII-encoded string.

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceST`

Bases: [`SequenceFe`](#)

String Terminator sequence (ST). Terminates strings in other control sequences. Encoded as ESC\ (0x1B 0x5C).

assemble() \rightarrow str

Build up actual byte sequence and return as an ASCII-encoded string.

__init__(*params: int | str)

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceOSC`

Bases: [`SequenceFe`](#)

Operating System Command sequence. Starts a control string for the operating system to use. Encoded as ESC[plus params separated by ;, and terminated with [`SequenceST`](#).

assemble() \rightarrow str

Build up actual byte sequence and return as an ASCII-encoded string.

__init__(*params: int | str)

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceCSI`

Bases: [`SequenceFe`](#)

Class representing CSI-type ANSI escape sequence. All subtypes of this sequence start with ESC[.

Sequences of this type can be used to control text formatting, change cursor position, erase screen and more.

__init__(terminator: str, *params: int | str)

classmethod **init_cursor_horizontal_absolute**(column: int = 1) \rightarrow [`SequenceCSI`](#)

Set cursor x-coordinate to column.

classmethod **init_erase_in_line**(mode: int = 0) \rightarrow [`SequenceCSI`](#)

Erase part of the line. If mode is 0, clear from cursor to the end of the line. If mode is 1, clear from cursor to beginning of the line. If mode is 2, clear entire line. Cursor position does not change.

assemble() \rightarrow str

Build up actual byte sequence and return as an ASCII-encoded string.

property params: `List[int | str]`

Return internal params as array.

class `pytermor.ansi.SequenceSGR`

Bases: [`SequenceCSI`](#)

Class representing SGR-type escape sequence with varying amount of parameters.

[`SequenceSGR`](#) with zero params was specifically implemented to translate into empty string and not into ESC[m, which would have made sense, but also would be very entangling, as this sequence is equivalent of ESC[0m – hard reset sequence. The empty-string-sequence is predefined as [`NOOP_SEQ`](#).

It's possible to add of one SGR sequence to another:

```
>>> SequenceSGR(31) + SequenceSGR(1) == SequenceSGR(31, 1)
True
```

__init__(*args: str | int | SequenceSGR)

Create new *SequenceSGR* with specified args as params.

Resulting sequence param order is same as an argument order.

Each sequence param can be specified as:

- string key (name of any constant defined in *IntCodes*, case-insensitive)
- integer param value (*IntCodes* values)
- existing *SequenceSGR* instance (params will be extracted).

```
>>> SequenceSGR('yellow', 'bold')
SGR[33;1]
>>> SequenceSGR(91, 7)
SGR[91;7]
>>> SequenceSGR(IntCodes.HI_CYAN, IntCodes.UNDERLINED)
SGR[96;4]
```

classmethod init_color_indexed(idx: int, bg: bool = False) → *SequenceSGR*

Wrapper for creation of *SequenceSGR* that sets foreground (or background) to one of 256-color palette value.

Parameters

- **idx** – Index of the color in the palette, 0 – 255.
- **bg** – Set to *True* to change the background color (default is foreground).

Returns

SequenceSGR with required params.

classmethod init_color_rgb(r: int, g: int, b: int, bg: bool = False) → *SequenceSGR*

Wrapper for creation of *SequenceSGR* operating in True Color mode (16M). Valid values for *r*, *g* and *b* are in range [0; 255]. This range linearly translates into [0x00; 0xFF] for each channel. The result value is composed as #RRGGBB. For example, sequence with color of #FF3300 can be created with:

```
SequenceSGR.init_color_rgb(255, 51, 0)
```

Parameters

- **r** – Red channel value, 0 – 255.
- **g** – Blue channel value, 0 – 255.
- **b** – Green channel value, 0 – 255.
- **bg** – Set to *True* to change the background color (default is foreground).

Returns

SequenceSGR with required params.

assemble() → str

Build up actual byte sequence and return as an ASCII-encoded string.

classmethod `init_cursor_horizontal_absolute(column: int = 1) → SequenceCSI`

Set cursor x-coordinate to column.

classmethod `init_erase_in_line(mode: int = 0) → SequenceCSI`

Erase part of the line. If mode is 0, clear from cursor to the end of the line. If mode is 1, clear from cursor to beginning of the line. If mode is 2, clear entire line. Cursor position does not change.

property params: List[int | str]

Return internal params as array.

class `pytermor.ansi.Span`

Class consisting of two [Sequence](#) instances – the first one, “opener”, tells the terminal that’s it should format subsequent characters as specified, and the second one, which reverses the effects of the first one.

__init__ (*opening_params: str | int | SequenceSGR)

Create a [Span](#) with specified control sequence(s) as an opening sequence and **automatically compose** second (closing) sequence that will terminate attributes defined in the first one while keeping the others (*soft* reset). Default constructor accepts SGR sequences (most frequently used sequence type).

Resulting sequence param order is same as an argument order.

Each argument can be specified as:

- string key (name of any constant defined in [IntCodes](#), case-insensitive)
- integer param value (IntCodes values)
- existing [SequenceSGR](#) instance (params will be extracted).

```
>>> Span('red', 'bold')
Span[SGR[31;1], SGR[39;22]]
>>> Span(IntCodes.GREEN)
Span[SGR[32], SGR[39]]
>>> Span(93, 4)
Span[SGR[93;4], SGR[39;24]]
>>> Span(Seqs.BG_BLACK + Seqs.RED)
Span[SGR[40;31], SGR[49;39]]
```

Parameters

opening_params – string keys, integer codes or existing [SequenceSGR](#) instances to build [Span](#) from.

classmethod `init_explicit(opening_seq: Optional[Sequence] = None, closing_seq: Optional[Sequence] = None, hard_reset_after: bool = False) → Span`

Create new [Span](#) with explicitly specified opening and closing sequences.

Note: `closing_seq` gets overwritten with `Seqs.RESET` if `hard_reset_after` is `True`.

Parameters

- **opening_seq** – Starter sequence, in general determining how [Span](#) will actually look like.
- **closing_seq** – Finisher sequence (usually both are SGR sequences, but it’s possible to provide any type).
- **hard_reset_after** – Terminate *all* formatting after this span (uses SGR 0).

classmethod `init_hyperlink(url: str) → Span`

Todo: s

Explicit markup ends without a blank line; unexpected unindent.

Parameters

url –

Returns

wrap(text: Optional[Any] = None) → str

Wrap given `text` string with SGRs defined on initialization – `opening_seq` on the left, `closing_seq` on the right. `str(text)` will be invoked for all argument types with the exception of `None`, which will be replaced with an empty string.

Parameters

text – String to wrap.

Returns

text enclosed in instance's SGRs, if any.

property `opening_str: str`

Return opening sequence assembled.

property `opening_seq: Sequence`

Return opening sequence instance.

property `closing_str: str`

Return closing sequence assembled.

property `closing_seq: Sequence`

Return closing sequence instance.

__call__(text: Optional[Any] = None) → str

Can be used instead of `wrap()` method.

```
>>> Spans.RED('text') == Spans.RED.wrap('text')
True
```

`pytermor.ansi.NOOP_SEQ = SGR[~]`

Special sequence in case you *have to* provide one or another SGR, but do not want any control sequences to be actually included in the output. `NOOP_SEQ.assemble()` returns empty string, `NOOP_SEQ.params` returns empty list.

```
>>> NOOP_SEQ.assemble()
''
>>> NOOP_SEQ.params
[]
```

`pytermor.ansi.NOOP_SPAN = Span[SGR[~], SGR[~]]`

Special `Span` in cases where you *have to* select one or another `Span`, but do not want any control sequence to be actually included.

- `NOOP_SPAN(string)` or `NOOP_SPAN.wrap(string)` returns `string` without any modifications;

- `NOOP_SPAN.opening_str` and `NOOP_SPAN.closing_str` are empty strings;
- `NOOP_SPAN.opening_seq` and `NOOP_SPAN.closing_seq` both returns [*NOOP_SEQ*](#).

```
>>> NOOP_SPAN('text')
'text'
>>> NOOP_SPAN.opening_str
''
>>> NOOP_SPAN.opening_seq
SGR[~]
```

class `pytermor.ansi.IntCodes`Bases: [*Registry*](#)[`int`]

Complete or almost complete list of reliably working SGR param integer codes.

Suitable for [*Span*](#) and [*SequenceSGR*](#) default constructors.

Attention: Registry constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [*Preset list*](#) section of the guide.

classmethod `resolve(name: str) → T`

Case-insensitive search through registry contents.

Parameters**name** – name of the value to look up for.**Returns**value or `KeyError` if nothing found.**class** `pytermor.ansi.Seqs`Bases: [*Registry*](#)[[*Sequence*](#)]

Registry of sequence presets.

Attention: Registry constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [*Preset list*](#) section of the guide.

RESET = `SGR[0]`

Hard reset sequence.

classmethod `resolve(name: str) → T`

Case-insensitive search through registry contents.

Parameters**name** – name of the value to look up for.**Returns**value or `KeyError` if nothing found.**class** `pytermor.ansi.Spans`Bases: [*Registry*](#)[[*Span*](#)]

Registry of span presets.

Attention: Registry constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [Preset list](#) section of the guide.

classmethod `resolve(name: str) → T`

Case-insensitive search through registry contents.

Parameters

name – name of the value to look up for.

Returns

value or `KeyError` if nothing found.

2.2 color

class `pytermor.color.Color`

Abstract superclass for other Colors.

__init__(*hex_value: Optional[int] = None*)

static `hex_value_to_hsv_channels(hex_value: int) → Tuple[int, float, float]`

Transforms *hex_value* in `0xffffffff` format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within `[0, 359]` range, *saturation* and *value* are within `[0; 1]` range.

static `rgb_channels_to_hex_value(r: int, g: int, b: int) → int`

Content block expected for the “todo” directive; none found.

```
.. todo ::
```

Parameters

- **r** –
- **g** –
- **b** –

Returns

static `hex_value_to_rgb_channels(hex_value: int) → Tuple[int, int, int]`

Transforms *hex_value* in `0xffffffff` format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within `[0; 255]` range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

`pytermor.color.TypeColor`

Any non-abstract [Color](#) type.

alias of `TypeVar('TypeColor', ColorIndexed16, ColorIndexed256, ColorRGB)`

class pytermor.color.ColorIndexed16Bases: `_ColorIndexed`**__init__**(*hex_value: Optional[int] = None, code_fg: Optional[int] = None, code_bg: Optional[int] = None*)**classmethod** **find_closest**(*hex_value: int*) → `_ColorIndexed`Wrapper for [Approximator.find_closest\(\)](#).**Parameters****hex_value** – Integer color value in 0xffffff format.**Returns**Nearest found `_ColorIndexed` instance.

```
>>> _ColorIndexed.find_closest(0xd9dbdb)
_ColorIndexed[code=253, 0xdadada]
```

static **hex_value_to_hsv_channels**(*hex_value: int*) → `Tuple[int, float, float]`

Transforms `hex_value` in 0xffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static **hex_value_to_rgb_channels**(*hex_value: int*) → `Tuple[int, int, int]`

Transforms `hex_value` in 0xffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

static **rgb_channels_to_hex_value**(*r: int, g: int, b: int*) → `int`

Content block expected for the “todo” directive; none found.

```
.. todo ::
```

Parameters

- **r** –
- **g** –
- **b** –

Returns**class** pytermor.color.ColorIndexed256Bases: `_ColorIndexed`

Todo: get color by int code

__init__(*hex_value: Optional[int] = None, code: Optional[int] = None*)

classmethod `find_closest(hex_value: int) → _ColorIndexed`

Wrapper for `Approximator.find_closest()`.

Parameters

hex_value – Integer color value in 0xffffffff format.

Returns

Nearest found `_ColorIndexed` instance.

```
>>> _ColorIndexed.find_closest(0xd9dbdb)
_ColorIndexed[code=253, 0xdadada]
```

static `hex_value_to_hsv_channels(hex_value: int) → Tuple[int, float, float]`

Transforms `hex_value` in 0xffffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static `hex_value_to_rgb_channels(hex_value: int) → Tuple[int, int, int]`

Transforms `hex_value` in 0xffffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x000001)
(0, 0, 1)
```

static `rgb_channels_to_hex_value(r: int, g: int, b: int) → int`

Content block expected for the “todo” directive; none found.

```
.. todo ::
```

Parameters

- **r** –
- **g** –
- **b** –

Returns

class `pytermor.color.ColorRGB`

Bases: `Color`

__init__(`hex_value: Optional[int] = None`)

static `hex_value_to_hsv_channels(hex_value: int) → Tuple[int, float, float]`

Transforms `hex_value` in 0xffffffff format into tuple of three numbers corresponding to *hue*, *saturation* and *value* channel values respectively. *Hue* is within [0, 359] range, *saturation* and *value* are within [0; 1] range.

static `hex_value_to_rgb_channels(hex_value: int) → Tuple[int, int, int]`

Transforms `hex_value` in 0xffffffff format into tuple of three integers corresponding to *red*, *blue* and *green* channel value respectively. Values are within [0; 255] range.

```
>>> Color.hex_value_to_rgb_channels(0x80ff80)
(128, 255, 128)
>>> Color.hex_value_to_rgb_channels(0x0000001)
(0, 0, 1)
```

static `rgb_channels_to_hex_value(r: int, g: int, b: int) → int`

Content block expected for the “todo” directive; none found.

```
.. todo ::
```

Parameters

- **r** –
- **g** –
- **b** –

Returns

class `pytermor.color.Approximator`

Internal class containing a dictionary of registered colors indexed by hex code along with cached nearest color search results to avoid unnecessary instance copies and search repeats.

__init__()

Called in `Color`-type class constructors. Each `Color` type should have class variable with instance of `Approximator` and create it by itself if it’s not present.

add_to_map(`color: _ColorIndexed`)

Called from `_ColorIndexed` constructors. Add a new element in color lookup table if it wasn’t there, and then drop cached search results as they are most probably useless after registering a new color (i.e. now there will be better result for at least one cached value).

Parameters

color – `Color` instance being created.

find_closest(`hex_value: int`) → `_ColorIndexed`

Search for nearest to `hex_value` registered color. Is used by `SgrRenderer` to find supported color alternatives in case user’s terminal is incapable of operating in better mode.

Parameters

hex_value – Color value in RGB format.

Returns

Nearest to `hex_value` registered `_ColorIndexed`. If no colors of required type were created (table and cache are empty), `NOOP_COLOR` is returned.

approximate(`hex_value: int, max_results: int = 1`) → `List[_ColorIndexed]`

Core color approximation method. Iterate the registered colors table, or *lookup table*, and compute the euclidean distance from argument to each color of the palette. Sort the results and return the first <max_results> of them.

Note: It’s not guaranteed that this method will **always** succeed in searching (the result list can be empty). Consider using `find_closest` instead, if you really want to be sure that at least some color will be returned. Another option is to use special “color” named `NOOP_COLOR`.

Todo: rewrite using HSV distance?

Parameters

- **hex_value** – Color RGB value.
- **max_results** – Maximum amount of values to return.

Returns

Closest `_ColorIndexed` instances found, sorted by color distance descending (i.e. 0th element is always the closest to the input value).

```
pytermor.color.NOOP_COLOR_INDEXED = ColorIndexed16[fg=None, bg=None, ~]
```

Special instance of `ColorIndexed16` class always rendering into empty string.

```
pytermor.color.NOOP_COLOR = ColorRGB[~]
```

Special instance of `ColorRGB` class always rendering into empty string.

```
class pytermor.color.Colors
```

Bases: `Registry[TypeColor]`

Registry of colors presets (`ColorIndexed16`, `ColorIndexed256`, `ColorRGB`).

Attention: Registry constants are omitted from API doc pages to improve readability and avoid duplication. Summary list of all presets can be found in [Preset list](#) section of the guide.

```
classmethod resolve(name: str) → T
```

Case-insensitive search through registry contents.

Parameters

name – name of the value to look up for.

Returns

value or `KeyError` if nothing found.

2.3 text

Module with output formatters. By default `SgrRenderer` is used. It also contains compatibility settings, see `SgrRenderer.setup()`.

Working with non-default renderer can be achieved in two ways:

- Method `RendererManager.set_default()` sets the default renderer globally. After that calling `Renderable.render()` will automatically invoke said renderer and all formatting will be applied.
- Alternatively, you can use renderer's own instance method `AbstractRenderer.render()` directly and avoid messing up with the manager: `HtmlRenderer().render(<Renderable>)`

TL;DR

To unconditionally print formatted message to output terminal, do something like this:

```
>>> from pytermor import SgrRenderer, Styles, Text
>>> renderer = RendererManager.set_forced_sgr_as_default()
>>> Text('Warning: AAAA', Styles.WARNING).render()
'\x1b[33mWarning: AAAA\x1b[39m'
```

Todo: Scheme can be simplified, too many unnecessary abstractions for now.

Renderable

(implemented by `Text`) should include algorithms for creating intermediate styles for text pieces that lie in between first opening sequence (or tag) and second, for example – this happens when one `Text` instance is included into another.

Style's

responsibility is to preserve the state of text piece and that's it.

Renderer

should transform style into corresponding output format and that's it.

API 2:

```
Text(string, style, leave_open = True) # no style means all open styles will be closed at the
end Text().append(string, style, leave_open = True) Text().prepend(string, style, leave_open = False)
Text().raw Text().apply(style) Text().render(with=AbstractRenderer()) Text() + Text() = Text().append(Text().raw,
Text().style) Text() + str = Text().append(str) str + Text() = Text().prepend(str)
```

```
Style(style, fg, bg...) # no Style().render()! AbstractRenderer().setup() AbstractRenderer().render(text) SgrRen-
derer().is_sgr_usage_allowed()
```

renderers should have instance methods only!

class `pytermor.text.Style`

Create a new `Style()`.

Key difference between `Styles` and `Spans` or `SGRs` is that `Styles` describe colors in RGB format and therefore support output rendering in several different formats (see `_render`).

Both `fg` and `bg` can be specified as:

1. `Color` instance or library preset;
2. key code – name of any of aforementioned presets, case-insensitive;
3. integer color value in hexadecimal RGB format.
4. `None` – the color will be unset.

Inheritance parent -> child works this way:

1. If an argument in child's constructor is empty (`=None`), take value from parent's corresponding attribute.
2. If an argument in child's constructor is *not* empty (`=True|False|Color` etc.), use it as child's attribute.

Note: There will be no empty (`=None`) attributes of type `Color` after initialization – they are replaced with special constant `NOOP_COLOR`, that works as if there was no color defined and allows to avoid writing of boilerplate code to check if a color is `None` here and there.

Parameters

- **parent** – Style to copy attributes without value from.
- **fg** – Foreground (i.e., text) color.
- **bg** – Background color.
- **blink** – Blinking effect; *supported by limited amount of Renderers*.
- **bold** – Bold or increased intensity.
- **crosslined** – Strikethrough.
- **dim** – Faint, decreased intensity.
- **double_underlined** – Faint, decreased intensity.
- **inversed** – Swap foreground and background colors.
- **italic** – Italic.
- **overlined** – Overline.
- **underlined** – Underline.
- **class_name** – Arbitrary string used by some renderers, e.g. by HtmlRenderer.

```
>>> Style(fg='green', bold=True)
Style[fg=008000, no bg, bold]
>>> Style(bg=0x0000ff)
Style[no fg, bg=0000ff]
>>> Style(fg=Colors.DEEP_SKY_BLUE_1, bg=Colors.GREY_93)
Style[fg=00afff, bg=eeeeee]
```

```
renderable_attributes = frozenset({'bg', 'blink', 'bold', 'crosslined', 'dim',
'double_underlined', 'fg', 'inversed', 'italic', 'overlined', 'underlined'})
```

```
__init__(parent: Style = None, fg: Color | int | str = None, bg: Color | int | str = None, blink: bool = None,
bold: bool = None, crosslined: bool = None, dim: bool = None, double_underlined: bool = None,
inversed: bool = None, italic: bool = None, overlined: bool = None, underlined: bool = None,
class_name: str = None)
```

autopick_fg() → *Style*

Pick fg_color depending on bg_color. Set fg_color to either 4% gray (almost black) if background is bright, or to 80% gray (bright gray) if it is dark. If background is None, do nothing.

Todo: check if there is a better algorithm, because current thinks text on #000080 should be black

Returns

self

flip() → *Style*

Swap foreground color and background color. :return: self

property attributes: **FrozenSet**

property fg: *Color*

property **bg**: *Color*

`pytermor.text.NOOP_STYLE = Style[no fg, no bg]`

Special style which passes the text further without any modifications.

class `pytermor.text.Text`

Bases: *Renderable*

`WIDTH_MAX_LEN_REGEX = re.compile('[\\d.]+$')`

`ALIGN_LEFT = '<'`

`ALIGN_RIGHT = '>'`

`ALIGN_CENTER = '^'`

`ALIGN_FUNC_MAP = {None: <function ljust_sgr>, '<': <function ljust_sgr>, '>': <function rjust_sgr>, '^': <function center_sgr>}`

`__init__(string: str = "", style: ~pytermor.text.Style = Style[no fg, no bg])`

`render(renderer: AbstractRenderer | Type[AbstractRenderer] = None) → str`

`raw() → str`

`append(string: str | Text, style: Style = Style[no fg, no bg]) → Text`

`prepend(string: str | Text, style: Style = Style[no fg, no bg]) → Text`

class `pytermor.text.RendererManager`

classmethod `set_default(renderer: AbstractRenderer | Type[AbstractRenderer] = None) → AbstractRenderer`

Set up renderer preferences. Affects all renderer types.

Parameters

renderer – Default renderer to use globally. Passing None will result in library default setting restored (*SgrRenderer*).

Returns

AbstractRenderer instance set as default.

```
>>> DebugRenderer().render('text', Style(fg='red'))
'|31|text|39|'
```

```
>>> NoOpRenderer().render('text', Style(fg='red'))
'text'
```

classmethod `get_default() → AbstractRenderer`

Get global default renderer (*SgrRenderer*, or the one provided to *setup*).

classmethod `set_forced_sgr_as_default() → AbstractRenderer`

class `pytermor.text.AbstractRenderer`

Renderer interface.

abstract `render(text: ~typing.Any, style: ~pytermor.text.Style = Style[no fg, no bg]) → str`

Apply colors and attributes described in *style* argument to *text* and return the result. Output format depends on renderer's class (which defines the implementation).

class pytermor.text.ConfigurableRenderer

setup(*force_styles*: bool | None = False, *compatibility_256_colors*: bool = False, *compatibility_16_colors*: bool = False) → *ConfigurableRenderer*

Set up renderer preferences.

Todo: Rewrite this part. Default should be 256 OR RGB if COLORTERM is either truecolor or 24bit. *setup()* overrides this, of course.

Parameters

- **force_styles** –
 - If set to *None*, renderer will pass input text through itself without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderer will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_256_colors** – Disable RGB (or True Color) output mode. 256-color sequences will be printed out instead of disabled ones. Useful when combined with curses – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_16_colors** – Disable 256-color output mode and default 16-color sequences instead. If this setting is set to *True*, the value of *compatibility_256_colors* will be ignored completely.

Returns

self

class pytermor.text.SgrRenderer

Bases: *AbstractRenderer*, *ConfigurableRenderer*

Default renderer invoked by *Text*.*_render()*. Transforms *Color* instances defined in *style* into ANSI control sequence bytes and merges them with input string.

Respects compatibility preferences (see *ConfigurableRenderer.setup()*) and maps RGB colors to closest indexed colors if terminal doesn't support RGB output. In case terminal doesn't support even 256 colors, falls back to 16-color palette and picks closest counterparts again the same way.

Type of output SequenceSGR depends on type of *Color* variables in *style* argument. Keeping all that in mind, let's summarize:

1. *ColorRGB* can be rendered as True Color sequence, 256-color sequence or 16-color sequence depending on compatibility settings.
2. *ColorIndexed256* can be rendered as 256-color sequence or 16-color sequence.
3. *ColorIndexed16* can be rendered as 16-color sequence.
4. Nothing of the above will happen and all Colors will be discarded completely if output is not a terminal emulator or if the developer explicitly set up the renderer to do so (**force_styles** = False).

```
>>> SgrRenderer().setup(True).render('text', Style(fg='red', bold=True))
'\x1b[1;31mtext\x1b[22;39m'
```

render(*text*: ~typing.Any, *style*: ~pytermor.text.Style = Style[no fg, no bg])

Apply colors and attributes described in *style* argument to *text* and return the result. Output format depends on renderer's class (which defines the implementation).

is_sgr_usage_allowed() → bool

setup(*force_styles*: bool | None = False, *compatibility_256_colors*: bool = False, *compatibility_16_colors*: bool = False) → [ConfigurableRenderer](#)

Set up renderer preferences.

Todo: Rewrite this part. Default should be 256 OR RGB if COLORTERM is either `truecolor` or `24bit`. [setup\(\)](#) overrides this, of course.

Parameters

- **force_styles** –
 - If set to *None*, renderer will pass input text through itself without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderer will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_256_colors** – Disable *RGB* (or True Color) output mode. *256-color* sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_16_colors** – Disable *256-color* output mode and default *16-color* sequences instead. If this setting is set to *True*, the value of `compatibility_256_colors` will be ignored completely.

Returns

self

class pytermor.text.TmuxRenderer

Bases: [SgrRenderer](#)

tmux

```
SGR_TO_TMUX_MAP = {SGR[~]: '', SGR[0]: 'default', SGR[1]: 'bold', SGR[2]:
'dim', SGR[3]: 'italics', SGR[4]: 'underscore', SGR[5]: 'blink', SGR[6]:
'blink', SGR[7]: 'reverse', SGR[8]: 'hidden', SGR[9]: 'strikethrough', SGR[21]:
'double-underscore', SGR[53]: 'overline', SGR[22]: 'nobold nodim', SGR[23]:
'noitalics', SGR[24]: 'nounderscore', SGR[25]: 'noblink', SGR[27]: 'noreverse',
SGR[28]: 'nohidden', SGR[29]: 'nostrikethrough', SGR[55]: 'nooverline', SGR[30]:
'fg=black', SGR[31]: 'fg=red', SGR[32]: 'fg=green', SGR[33]: 'fg=yellow',
SGR[34]: 'fg=blue', SGR[35]: 'fg=magenta', SGR[36]: 'fg=cyan', SGR[37]:
'fg=white', SGR[39]: 'fg=default', SGR[40]: 'bg=black', SGR[41]: 'bg=red',
SGR[42]: 'bg=green', SGR[43]: 'bg=yellow', SGR[44]: 'bg=blue', SGR[45]:
'bg=magenta', SGR[46]: 'bg=cyan', SGR[47]: 'bg=white', SGR[49]: 'bg=default',
SGR[90]: 'fg=brightblack', SGR[91]: 'fg=brightred', SGR[92]: 'fg=brightgreen',
SGR[93]: 'fg=brightyellow', SGR[94]: 'fg=brightblue', SGR[95]:
'fg=brightmagenta', SGR[96]: 'fg=brightcyan', SGR[97]: 'fg=brightwhite', SGR[100]:
'bg=brightblack', SGR[101]: 'bg=brightred', SGR[102]: 'bg=brightgreen', SGR[103]:
'bg=brightyellow', SGR[104]: 'bg=brightblue', SGR[105]: 'bg=brightmagenta',
SGR[106]: 'bg=brightcyan', SGR[107]: 'bg=brightwhite'}
```

render(text: ~typing.Any, style: ~pytermor.text.Style = Style[no fg, no bg])

Apply colors and attributes described in style argument to text and return the result. Output format depends on renderer's class (which defines the implementation).

is_sgr_usage_allowed() → bool

setup(force_styles: bool | None = False, compatibility_256_colors: bool = False, compatibility_16_colors: bool = False) → [ConfigurableRenderer](#)

Set up renderer preferences.

Todo: Rewrite this part. Default should be 256 OR RGB if COLORTERM is either truecolor or 24bit. [setup\(\)](#) overrides this, of course.

Parameters

- **force_styles** –
 - If set to *None*, renderer will pass input text through itself without any changes (i.e. no colors and attributes will be applied).
 - If set to *True*, renderer will always apply the formatting regardless of other internal rules and algorithms.
 - If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_256_colors** – Disable RGB (or True Color) output mode. 256-color sequences will be printed out instead of disabled ones. Useful when combined with `curses` – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_16_colors** – Disable 256-color output mode and default 16-color sequences instead. If this setting is set to *True*, the value of `compatibility_256_colors` will be ignored completely.

Returns

self

class pytermor.text.NoOpRendererBases: [AbstractRenderer](#)

Special renderer type that does nothing with the input string and just returns it as is. That's true only when it `_is_` a str beforehand; otherwise argument will be casted to str and then returned.

```
>>> NoOpRenderer().render('text', Style(fg='red', bold=True))
'text'
```

render(text: ~typing.Any, style: ~pytermor.text.Style = Style[no fg, no bg]) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

class pytermor.text.HtmlRendererBases: [AbstractRenderer](#)

html

```
>>> HtmlRenderer().render('text', Style(fg='red', bold=True))
'<span style="color: #800000; font-weight: 700">text</span>'
```

DEFAULT_ATTRS = ['color', 'background-color', 'font-weight', 'font-style', 'text-decoration', 'border', 'filter']**render**(text: ~typing.Any, style: ~pytermor.text.Style = Style[no fg, no bg]) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

class pytermor.text.DebugRendererBases: [SgrRenderer](#)

DebugRenderer

```
>>> DebugRenderer().setup(True).render('text', Style(fg='red', bold=True))
'|1;31|text|22;39|'
```

render(text: ~typing.Any, style: ~pytermor.text.Style = Style[no fg, no bg]) → str

Apply colors and attributes described in `style` argument to `text` and return the result. Output format depends on renderer's class (which defines the implementation).

is_sgr_usage_allowed() → bool**setup**(force_styles: bool | None = False, compatibility_256_colors: bool = False, compatibility_16_colors: bool = False) → [ConfigurableRenderer](#)

Set up renderer preferences.

Todo: Rewrite this part. Default should be 256 OR RGB if COLORTERM is either `truecolor` or `24bit`. [setup\(\)](#) overrides this, of course.

Parameters

- **force_styles** –
 - If set to *None*, renderer will pass input text through itself without any changes (i.e. no colors and attributes will be applied).

- If set to *True*, renderer will always apply the formatting regardless of other internal rules and algorithms.
- If set to *False* [default], the final decision will be made by every renderer independently, based on their own algorithms.
- **compatibility_256_colors** – Disable *RGB* (or True Color) output mode. *256-color* sequences will be printed out instead of disabled ones. Useful when combined with *curses* – that way you can check the terminal capabilities from the inside of that terminal and switch to different output mode at once.
- **compatibility_16_colors** – Disable *256-color* output mode and default *16-color* sequences instead. If this setting is set to *True*, the value of *compatibility_256_colors* will be ignored completely.

Returns

self

class pytermor.text.StylesBases: *Registry[Style]*

Some ready-to-use styles. Can be used as examples.

This registry has unique keys in comparsion with other ones (*Seqs / Spans / IntCodes*). Therefore there is no risk of key/value duplication and all presets can be listed in the initial place – at API docs page directly.

WARNING = *Style*[fg=808000, no bg]**WARNING_LABEL** = *Style*[fg=808000, no bg, bold]**WARNING_ACCENT** = *Style*[fg=ffff00, no bg]**ERROR** = *Style*[fg=800000, no bg]**classmethod resolve**(name: str) → T

Case-insensitive search through registry contents.

Parameters**name** – name of the value to look up for.**Returns**value or *KeyError* if nothing found.**ERROR_LABEL** = *Style*[fg=800000, no bg, bold]**ERROR_ACCENT** = *Style*[fg=ff0000, no bg]**CRITICAL** = *Style*[fg=ffffff, bg=ff0000]**CRITICAL_LABEL** = *Style*[fg=ffffff, bg=ff0000, bold]**CRITICAL_ACCENT** = *Style*[fg=ffffff, bg=ff0000, bold, blink]

pytermor.text.render(text: ~typing.Any, style: ~pytermor.text.Style = *Style*[no fg, no bg], renderer: ~typing.Optional[~pytermor.text.AbstractRenderer] = None)

2.4 util

Package containing a set of formatters for prettier output, as well as utility classes for removing some of the boilerplate code when dealing with escape sequences.

`pytermor.util.format_thousand_sep(value: int | float, separator=' ')`

Returns input value with integer part splitted into groups of three digits, joined then with `separator` string.

```
>>> format_thousand_sep(260341)
'260 341'
>>> format_thousand_sep(-9123123123.55, ',')
'-9,123,123,123.55'
```

`pytermor.util.distribute_padded(values: List[str | Renderable], max_len: int, pad_before: bool = False, pad_after: bool = False) → str`

Todo: todo

Parameters

- `values` –
- `max_len` –
- `pad_before` –
- `pad_after` –

Returns

2.4.1 auto_float

`pytermor.util.auto_float.format_auto_float(value: float, req_len: int, allow_exponent_notation: bool = True) → str`

Dynamically adjust decimal digit amount and format to fill up the output string with as many significant digits as possible, and keep the output length strictly equal to `req_len` at the same time.

```
>>> format_auto_float(0.016789, 5)
'0.017'
>>> format_auto_float(0.167891, 5)
'0.168'
>>> format_auto_float(1.567891, 5)
'1.568'
>>> format_auto_float(12.56789, 5)
'12.57'
>>> format_auto_float(123.5678, 5)
'123.6'
>>> format_auto_float(1234.567, 5)
' 1235'
>>> format_auto_float(12345.67, 5)
'12346'
```

For cases when it's impossible to fit a number in the required length and rounding doesn't help (e.g. 12 500 000 and 5 chars) algorithm switches to scientific notation and the result looks like '1.2e7'.

When exponent form is disabled, there are two options for value that cannot fit into required length:

- 1) if absolute value is less than 1, zeros will be displayed ('0.0000');
- 2) in case of big numbers (like 10^9) ValueError will be raised instead.

Parameters

- **value** – Value to format
- **req_len** – Required output string length
- **allow_exponent_notation** – Enable/disable exponent form.

Returns

Formatted string of required length

Raises

ValueError –

New in version 1.7.

2.4.2 prefixed_unit

`pytermor.util.prefixed_unit.format_si_metric(value: float, unit: str = 'm') → str`

Format value as meters with SI-prefixes, max result length is 7 chars: 4 for value plus 3 for default unit, prefix and separator. Base is 1000. Unit can be customized.

```
>>> format_si_metric(1010, 'm²')
'1.01 km²'
>>> format_si_metric(0.0319, 'g')
'31.9 mg'
>>> format_si_metric(1213531546, 'W') # great scott
'1.21 GW'
>>> format_si_metric(1.26e-9, 'eV')
'1.26 neV'
```

Parameters

- **value** – Input value (unitless).
- **unit** – Value unit, printed right after the prefix.

Returns

Formatted string with SI-prefix if necessary.

New in version 2.0.

`pytermor.util.prefixed_unit.format_si_binary(value: float, unit: str = 'b') → str`

Format value as binary size (bytes, kbytes, Mbytes), max result length is 8 chars: 5 for value plus 3 for default unit, prefix and separator. Base is 1024. Unit can be customized.

```
>>> format_si_binary(1010) # 1010 b < 1 kb
'1010 b'
>>> format_si_binary(1080)
'1.055 kb'
>>> format_si_binary(45200)
'44.14 kb'
>>> format_si_binary(1.258 * pow(10, 6), 'bps')
'1.200 Mbps'
```

Parameters

- **value** – Input value in bytes.
- **unit** – Value unit, printed right after the prefix.

Returns

Formatted string with SI-prefix if necessary.

New in version 2.0.

class pytermor.util.prefixed_unit.PrefixedUnitFormatter

Formats value using settings passed to constructor. The main idea of this class is to fit into specified string length as much significant digits as it's theoretically possible by using multipliers and unit prefixes to indicate them.

You can create your own formatters if you need fine tuning of the output and customization. If that's not the case, there are facade methods `format_si_metric()` and `format_si_binary()`, which will invoke predefined formatters and doesn't require setting up.

Todo: params

Parameters

prefix_zero_idx – Index of prefix which will be used as default, i.e. without multiplying coefficients.

New in version 1.7.

```
__init__(max_value_len: int, truncate_frac: bool = False, unit: str = None, unit_separator: str = None,
         mcoef: float = 1000.0, prefixes: List[str | None] = None, prefix_zero_idx: int = None)
```

property max_len: int

Returns

Maximum length of the result. Note that constructor argument is `max_value_len`, which is different parameter.

format(value: float, unit: Optional[str] = None) → str

Parameters

- **value** – Input value
- **unit** – Unit override

Returns

Formatted value

```
pytermor.util.prefixed_unit.PREFIXES_SI = ['y', 'z', 'a', 'f', 'p', 'n', '', 'm', None, 'k', 'M', 'G', 'T', 'P', 'E', 'Z', 'Y']
```

Prefix presets used by default module formatters. Can be useful if you are building your own formatter.

```
pytermor.util.prefixed_unit.PREFIX_ZERO_SI = 8
```

Index of prefix which will be used as default, i.e. without multiplying coefficients.

2.4.3 time_delta

Module for time difference formatting (e.g. “4 days 15 hours”, “8h 59m”).

Supports several output lengths and can be customized even more.

```
pytermor.util.time_delta.format_time_delta(seconds: float, max_len: Optional[int] = None) → str
```

Format time delta using suitable format (which depends on `max_len` argument). Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”,

There are predefined formatters with output length of 3, 4, 6 and 10 characters. Therefore, you can pass in any value from 3 inclusive and it’s guaranteed that result’s length will be less or equal to required length. If `max_len` is omitted, longest registered formatter will be used.

```
>>> format_time_delta(10, 3)
'10s'
>>> format_time_delta(10, 6)
'10 sec'
>>> format_time_delta(15350, 4)
'4 h'
>>> format_time_delta(15350)
'4h 15min'
```

Parameters

- **seconds** – Value to format
- **max_len** – Maximum output string length (total)

Returns

Formatted string

```
class pytermor.util.time_delta.TimeDeltaFormatter
```

Formatter for time intervals. Key feature of this formatter is ability to combine two units and display them simultaneously, e.g. return “3h 48min” instead of “228 mins” or “3 hours”, etc.

You can create your own formatters if you need fine tuning of the output and customization. If that’s not the case, there is a facade method `format_time_delta()` which will select appropriate formatter automatically.

Example output:

```
"10 secs", "5 mins", "4h 15min", "5d 22h"
```

```
__init__(units: List[TimeUnit], allow_negative: bool, unit_separator: Optional[str] = None, plural_suffix: Optional[str] = None, overflow_msg: str = 'OVERFLOW')
```

property max_len: int

This property cannot be set manually, it is computed on initialization automatically.

Returns

Maximum possible output string length.

format(seconds: float, always_max_len: bool = False) → str

Pretty-print difference between two moments in time.

Parameters

- **seconds** – Input value.
- **always_max_len** – If result string is less than *max_len* it will be returned as is, unless this flag is set to *True*. In that case output string will be padded with spaces on the left side so that resulting length would be always equal to maximum length.

Returns

Formatted string.

format_raw(seconds: float) → str | None

Pretty-print difference between two moments in time, do not replace the output with “OVERFLOW” warning message.

Parameters

seconds – Input value.

Returns

Formatted string or *None* on overflow (if input value is too big for the current formatter to handle).

class pytermor.util.time_delta.TimeUnit

TimeUnit(name: 'str', in_next: 'int' = None, custom_short: 'str' = None, collapsible_after: 'int' = None, overflow_afer: 'int' = None)

name: str

in_next: int = None

custom_short: str = None

collapsible_after: int = None

overflow_afer: int = None

__init__(name: str, in_next: Optional[int] = None, custom_short: Optional[str] = None, collapsible_after: Optional[int] = None, overflow_afer: Optional[int] = None) → None

2.4.4 stdlib_ext

Some of the Python Standard Library methods rewritten for correct work with strings containing control sequences.

pytermor.util.stdlib_ext.ljust_sgr(s: str, width: int, fillchar: str = ' ', actual_len: Optional[int] = None) → str

SGR-formatting-aware implementation of `str.ljust`.

Return a left-justified string of length *width*. Padding is done using the specified fill character (default is a space).

```
pytermor.util.stdlib_ext.rjust_sgr(s: str, width: int, fillchar: str = ' ', actual_len: Optional[int] = None)
    → str
```

SGR-formatting-aware implementation of `str.rjust`.

Return a right-justified string of length `width`. Padding is done using the specified fill character (default is a space).

```
pytermor.util.stdlib_ext.center_sgr(s: str, width: int, fillchar: str = ' ', actual_len: Optional[int] = None)
    → str
```

SGR-formatting-aware implementation of `str.center`.

Return a centered string of length `width`. Padding is done using the specified fill character (default is a space).

Todo: (.) – f-

2.4.5 string_filter

String filtering module.

Main idea is to provide a common interface for string filtering, that can make possible working with filters like with objects rather than with functions/lambda's.

```
pytermor.util.string_filter.apply_filters(s: ST, *args: StringFilter | Type[StringFilter]) → ST
```

Method for applying dynamic filter list to a target string/bytes. Example (will replace all ESC control characters to E and thus make SGR params visible):

```
>>> apply_filters(Spans.RED('test'), ReplaceSGR(r'E\2\3\5'))
'E[31mtestE[39m'
```

Note that type of `s` argument must be same as `StringFilter` parameterized type, i.e. `ReplaceNonAsciiBytes` is `StringFilter[bytes]` type, so you can apply it only to bytes-type strings.

Parameters

- **s** (*AnyStr*) – String to filter.
- **args** – *StringFilter* instance(s) or *StringFilter* class(es).

Returns

Filtered `s`.

```
class pytermor.util.string_filter.StringFilter
```

Bases: `Generic[ST]`

Common string modifier interface.

```
__init__(pattern: ST | Pattern[ST], repl: ST | Callable[[ST | Match], ST])
```

```
__call__(s: ST) → ST
```

Can be used instead of `apply()`

```
apply(s: ST) → ST
```

Apply filter to `s` string (or bytes).

```
static __new__(cls, *args, **kws)
```

class pytermor.util.string_filter.VisualuzeWhitespace

Bases: [StringFilter](#)[str]

Replace every invisible character with `repl` (default is `.`), except newlines. Newlines are kept and get prepended with same string.

```
>>> VisualuzeWhitespace().apply('A B C')
'A..B..C'
>>> apply_filters('1. D\n2. L ', VisualuzeWhitespace)
'1..D.\n2..L.'
```

__init__(*repl: str* = `'.'`)

__call__(*s: ST*) → ST

Can be used instead of *apply()*

static **__new__**(*cls, *args, **kws*)

apply(*s: ST*) → ST

Apply filter to *s* string (or bytes).

class pytermor.util.string_filter.ReplaceSGR

Bases: [StringFilter](#)[str]

Find all SGR seqs (e.g. `ESC[1;4m`) and replace with given string. More specific version of [ReplaceCSI](#).

Parameters

repl – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).

__init__(*repl: str* = `''`)

__call__(*s: ST*) → ST

Can be used instead of *apply()*

static **__new__**(*cls, *args, **kws*)

apply(*s: ST*) → ST

Apply filter to *s* string (or bytes).

class pytermor.util.string_filter.ReplaceCSI

Bases: [StringFilter](#)[str]

Find all CSI seqs (i.e. starting with `ESC[`) and replace with given string. Less specific version of [ReplaceSGR](#), as CSI consists of SGR and many other sequence subtypes.

Parameters

repl – Replacement, can contain regexp groups (see [apply_filters\(\)](#)).

__init__(*repl: str* = `''`)

__call__(*s: ST*) → ST

Can be used instead of *apply()*

static **__new__**(*cls, *args, **kws*)

apply(*s: ST*) → ST

Apply filter to *s* string (or bytes).

class pytermor.util.string_filter.ReplaceNonAsciiBytes

Bases: [StringFilter](#)[bytes]

Keep 7-bit ASCII bytes [0x00 - 0x7f], replace other to ?.

Parameters

repl – Replacement byte-string.

__call__(s: ST) → ST

Can be used instead of *apply*()

__init__(repl: bytes = b'?')

static **__new__**(cls, *args, **kws)

apply(s: ST) → ST

Apply filter to s string (or bytes).

2.5 common

pytermor.common.T

Any

alias of TypeVar('T')

class pytermor.common.Registry

Bases: [Generic](#)[T]

Registry of elements of specified type.

classmethod **resolve**(name: str) → T

Case-insensitive search through registry contents.

Parameters

name – name of the value to look up for.

Returns

value or [KeyError](#) if nothing found.

pytermor.common.get_terminal_width() → int

Returns

terminal_width

pytermor.common.wait_key() → AnyStr | None

Wait for a key press on the console and return it.

exception pytermor.common.LogicError

Bases: [Exception](#)

__init__(*args, **kwargs)

with_traceback()

[Exception.with_traceback\(tb\)](#) – set self.__traceback__ to tb and return self.

class pytermor.common.Renderable

Bases: [Sized](#)

Renderable abstract class. Can be inherited if the default style overlaps resolution mechanism implemented in [Text](#) is not good enough and you want to implement your own.

CHANGELOG

3.1 v2.0.0

- Complete library rewrite.
- High-level abstractions *Color*, *Renderer* and *Style*.
- Unit tests for formatters and new modules.
- pytest and coverage integration.
- sphinx and readthedocs integraton.

3.2 v1.8.0

- `format_prefixed_unit` extended for working with decimal and binary metric prefixes.
- `format_time_delta` extended with new settings.
- Value rounding transferred from `format_auto_float` to `format_prefixed_unit`.
- Utility classes reorganization.
- Unit tests output formatting.
- `sequence.NOOP` SGR sequence and `span.NOOP` format.
- Max decimal points for `auto_float` extended from (2) to (max-2).

3.3 v1.7.4

- Added 3 formatters: `format_prefixed_unit`, `format_time_delta`, `format_auto_float`.

3.4 v1.7.3

- Added `span.BG_BLACK` format.

3.5 v1.7.2

- Added `ljust_sgr`, `rjust_sgr`, `center_sgr` util functions to align strings with SGRs correctly.

3.6 v1.7.1

- Print reset sequence as `\e[m` instead of `\e[0m`.

3.7 v1.7.0

- `Span` constructor can be called without arguments.
- Added SGR code lists.

3.8 v1.6.2

- Excluded `tests` dir from distribution package.

3.9 v1.6.1

- Ridded of `EmptyFormat` and `AbstractFormat` classes.
- Renamed code module to `sgr` because of conflicts in PyCharm debugger (`pydevd_console_integration.py`).

3.10 v1.5.0

- Removed excessive `EmptySequenceSGR` – default SGR class was specifically implemented to print out as empty string instead of `\e[m` if constructed without params.

3.11 v1.4.0

- `Span.wrap()` now accepts any type of argument, not only `str`.
- Rebuilt Sequence inheritance tree.
- Added equality methods for `SequenceSGR` and `Span` classes/subclasses.
- Added some tests for `fmt.*` and `seq.*` classes.

3.12 v1.3.2

- Added `span.GRAY` and `span.BG_GRAY` format presets.

3.13 v1.3.1

- Interface revisioning.

3.14 v1.2.1

- `opening_seq` and `closing_seq` properties for `Span` class.

3.15 v1.2.0

- `EmptySequenceSGR` and `EmptyFormat` classes.

3.16 v1.1.0

- Autoformat feature.

3.17 v1.0.0

- First public version.

This project uses Semantic Versioning – <https://semver.org> (*starting from 2.0.0*)
